# Chapter 1. MODULES

## Here is a list of all modules:

- Mathematical Functions
- Single Precision Mathematical Functions
- Double Precision Mathematical Functions
- Single Precision Intrinsics
- ► Double Precision Intrinsics
- ► Integer Intrinsics
- Type Casting Intrinsics
- SIMD Intrinsics
- Half Precision Intrinsics
  - ► Half Arithmetic Functions
  - ► Half2 Arithmetic Functions
  - ► Half Comparison Functions
  - ► Half2 Comparison Functions
  - Half Precision Conversion And Data Movement

# 1.1. Mathematical Functions

CUDA mathematical functions are always available in device code. Some functions are also available in host code as indicated.

Note that floating-point functions are overloaded for different argument types. For example, the log() function has the following prototypes:

```
f double log(double x);
  float log(float x);
  float logf(float x);
```

# 1.2. Single Precision Mathematical Functions

This section describes single precision mathematical functions.

\_\_host\_\_\_\_device\_\_ float acosf (float x)

Calculate the arc cosine of the input argument.

#### Returns

Result will be in radians, in the interval  $[0, \pi]$  for x inside [-1, +1].

- ightharpoonup acosf(1) returns +0.
- $a\cos f(x)$  returns NaN for x outside [-1, +1].

## Description

Calculate the principal value of the arc cosine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float acoshf (float x)

Calculate the nonnegative arc hyperbolic cosine of the input argument.

#### Returns

Result will be in the interval  $[0, +\infty]$ .

- acoshf(1) returns 0.
- ▶  $a\cosh(x)$  returns NaN for x in the interval  $[-\infty, 1)$ .

## Description

Calculate the nonnegative arc hyperbolic cosine of the input argument x.

\_\_host\_\_\_\_device\_\_ float asinf (float x)

Calculate the arc sine of the input argument.

#### Returns

Result will be in radians, in the interval  $[-\pi/2, +\pi/2]$  for x inside [-1, +1].

- asinf(0) returns +0.
- asinf(x) returns NaN for x outside [-1, +1].

# Description

Calculate the principal value of the arc sine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float asinhf (float x)

Calculate the arc hyperbolic sine of the input argument.

#### Returns

asinhf(0) returns 1.

# **Description**

Calculate the arc hyperbolic sine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float atan2f (float y, float x)

Calculate the arc tangent of the ratio of first and second input arguments.

#### Returns

Result will be in radians, in the interval [- $\pi$ , + $\pi$ ].

atan2f(0, 1) returns +0.

Calculate the principal value of the arc tangent of the ratio of first and second input arguments y / x. The quadrant of the result is determined by the signs of inputs y and x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float atanf (float x)

Calculate the arc tangent of the input argument.

#### Returns

Result will be in radians, in the interval [- $\pi/2$ , + $\pi/2$ ].

ightharpoonup atanf(0) returns +0.

# Description

Calculate the principal value of the arc tangent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float atanhf (float x)

Calculate the arc hyperbolic tangent of the input argument.

#### Returns

- atanhf(  $\pm 0$ ) returns  $\pm 0$ .
- ▶ atanhf(  $\pm 1$ ) returns  $\pm \infty$ .
- atanhf(x) returns NaN for x outside interval [-1, 1].

## Description

Calculate the arc hyperbolic tangent of the input argument x.

# \_\_host\_\_\_\_device\_\_ float cbrtf (float x)

Calculate the cube root of the input argument.

#### Returns

Returns  $x^{1/3}$ .

- cbrtf(  $\pm 0$  ) returns  $\pm 0$ .
- ▶ cbrtf(  $\pm \infty$ ) returns  $\pm \infty$ .

# Description

Calculate the cube root of x,  $x^{1/3}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float ceilf (float x)

Calculate ceiling of the input argument.

#### Returns

Returns  $\Box x \Box$  expressed as a floating-point number.

- ceilf(  $\pm 0$ ) returns  $\pm 0$ .
- ceilf(  $\pm \infty$  ) returns  $\pm \infty$ .

## Description

Compute the smallest integer value not less than x.

\_\_host\_\_\_\_device\_\_ float copysignf (float x, float y)

Create value with given magnitude, copying sign of second value.

#### Returns

Returns a value with the magnitude of x and the sign of y.

# Description

Create a floating-point value with the magnitude x and the sign of y.

# \_\_host\_\_\_\_device\_\_ float cosf (float x)

Calculate the cosine of the input argument.

#### Returns

- ightharpoonup cosf(0) returns 1.
- ▶  $cosf(\pm \infty)$  returns NaN.

# Description

Calculate the cosine of the input argument x (measured in radians).

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ float coshf (float x)

Calculate the hyperbolic cosine of the input argument.

#### Returns

- coshf(0) returns 1.
- ▶  $\cosh(\pm \infty)$  returns NaN.

# Description

Calculate the hyperbolic cosine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_host\_\_\_\_device\_\_ float cospif (float x)

Calculate the cosine of the input argument  $\times \pi$ .

#### Returns

- cospif(  $\pm 0$  ) returns 1.
- ▶ cospif(  $\pm \infty$  ) returns NaN.

Calculate the cosine of  $x \times \pi$  (measured in radians), where x is the input argument.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_host\_\_\_\_device\_\_ float cyl\_bessel\_i0f (float x)

Calculate the value of the regular modified cylindrical Bessel function of order 0 for the input argument.

#### Returns

Returns the value of the regular modified cylindrical Bessel function of order 0.

## Description

Calculate the value of the regular modified cylindrical Bessel function of order 0 for the input argument  $\times$ ,  $I_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float cyl\_bessel\_i1f (float x)

Calculate the value of the regular modified cylindrical Bessel function of order 1 for the input argument.

#### Returns

Returns the value of the regular modified cylindrical Bessel function of order 1.

## Description

Calculate the value of the regular modified cylindrical Bessel function of order 1 for the input argument x,  $I_1(x)$ .

# \_\_host\_\_\_\_device\_\_ float erfcf (float x)

Calculate the complementary error function of the input argument.

#### Returns

- erfcf( $-\infty$ ) returns 2.
- erfcf(  $+\infty$  ) returns +0.

# Description

Calculate the complementary error function of the input argument x, 1 - erf(x).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float erfcinvf (float y)

Calculate the inverse complementary error function of the input argument.

#### Returns

- erfcinvf(0) returns  $+\infty$ .
- erfcinvf(2) returns  $-\infty$ .

# Description

Calculate the inverse complementary error function of the input argument y, for y in the interval [0, 2]. The inverse complementary error function find the value x that satisfies the equation  $y = \operatorname{erfc}(x)$ , for  $0 \le y \le 2$ , and  $-\infty \le x \le \infty$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float erfcxf (float x)

Calculate the scaled complementary error function of the input argument.

#### Returns

- erfcxf( $-\infty$ ) returns  $+\infty$
- erfcxf(  $+\infty$  ) returns +0
- erfcxf(x) returns  $+\infty$  if the correctly calculated value is outside the single floating point range.

Calculate the scaled complementary error function of the input argument x,  $e^{x^2} \cdot \operatorname{erfc}(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_host\_\_\_\_device\_\_ float erff (float x)

Calculate the error function of the input argument.

#### Returns

- erff(  $\pm 0$ ) returns  $\pm 0$ .
- erff(  $\pm \infty$ ) returns  $\pm 1$ .

# Description

Calculate the value of the error function for the input argument  $\times$ ,  $\frac{2}{\sqrt{\pi}} \int_{0}^{x} e^{-t^2} dt$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float erfinvf (float y)

Calculate the inverse error function of the input argument.

#### Returns

- erfinvf(1) returns  $+\infty$ .
- erfinvf(-1) returns  $-\infty$ .

# Description

Calculate the inverse error function of the input argument y, for y in the interval [-1, 1]. The inverse error function finds the value x that satisfies the equation y = erf(x), for  $-1 \le y \le 1$ , and  $-\infty \le x \le \infty$ .

# \_\_host\_\_\_\_device\_\_ float exp10f (float x)

Calculate the base 10 exponential of the input argument.

#### Returns

Returns  $10^{x}$ .

# Description

Calculate the base 10 exponential of the input argument x.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ float exp2f (float x)

Calculate the base 2 exponential of the input argument.

#### Returns

Returns  $2^x$ .

## Description

Calculate the base 2 exponential of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float expf (float x)

Calculate the base *e* exponential of the input argument.

#### Returns

Returns  $e^{x}$ .

## Description

Calculate the base *e* exponential of the input argument x,  $e^x$ .

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ float expm1f (float x)

Calculate the base e exponential of the input argument, minus 1.

#### Returns

Returns  $e^x - 1$ .

# Description

Calculate the base e exponential of the input argument x, minus 1.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float fabsf (float x)

Calculate the absolute value of its argument.

#### Returns

Returns the absolute value of its argument.

- fabs(  $\pm \infty$  ) returns  $+ \infty$ .
- fabs(  $\pm 0$  ) returns 0.

# Description

Calculate the absolute value of the input argument x.

# \_\_host\_\_\_\_device\_\_ float fdimf (float x, float y)

Compute the positive difference between x and y.

#### Returns

Returns the positive difference between x and y.

- fdimf(x, y) returns x y if x > y.
- fdimf(x, y) returns +0 if  $x \le y$ .

# Description

Compute the positive difference between x and y. The positive difference is x - y when x > y and +0 otherwise.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float fdividef (float x, float y)

Divide two floating point values.

#### Returns

Returns x / y.

## Description

Compute x divided by y. If --use\_fast\_math is specified, use \_\_fdividef() for higher performance, otherwise use normal division.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ float floorf (float x)

Calculate the largest integer less than or equal to x.

#### **Returns**

Returns  $log_o(1+x)$  expressed as a floating-point number.

- ▶ floorf(  $\pm \infty$ ) returns  $\pm \infty$ .
- floorf(  $\pm 0$ ) returns  $\pm 0$ .

# Description

Calculate the largest integer value which is less than or equal to x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_device\_\_ float fmaf (float x, float y, float z)

Compute  $x \times y + z$  as a single operation.

#### Returns

Returns the rounded value of  $x \times y + z$  as a single operation.

- fmaf(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- fmaf(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fmaf(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fmaf(x, y,  $+\infty$ ) returns NaN if  $x \times y$  is an exact  $-\infty$ .

## Description

Compute the value of  $x \times y + z$  as a single ternary operation. After computing the value to infinite precision, the value is rounded once.

# \_\_host\_\_\_\_device\_\_ float fmaxf (float x, float y)

Determine the maximum numeric value of the arguments.

#### Returns

Returns the maximum numeric values of the arguments x and y.

- ▶ If both arguments are NaN, returns NaN.
- ▶ If one argument is NaN, returns the numeric argument.

# Description

Determines the maximum numeric value of the arguments x and y. Treats NaN arguments as missing data. If one argument is a NaN and the other is legitimate numeric value, the numeric value is chosen.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float fminf (float x, float y)

Determine the minimum numeric value of the arguments.

#### Returns

Returns the minimum numeric values of the arguments x and y.

- If both arguments are NaN, returns NaN.
- ▶ If one argument is NaN, returns the numeric argument.

## Description

Determines the minimum numeric value of the arguments x and y. Treats NaN arguments as missing data. If one argument is a NaN and the other is legitimate numeric value, the numeric value is chosen.

# \_\_host\_\_\_\_device\_\_ float fmodf (float x, float y)

Calculate the floating-point remainder of x / y.

#### Returns

- Returns the floating point remainder of x / y.
- fmodf(  $\pm 0$ , y) returns  $\pm 0$  if y is not zero.
- ▶ fmodf(x, y) returns NaN and raised an invalid floating point exception if x is  $\pm \infty$  or y is zero.
- fmodf(x, y) returns zero if y is zero or the result would overflow.
- fmodf(x,  $\pm \infty$ ) returns x if x is finite.
- fmodf(x, 0) returns NaN.

## Description

Calculate the floating-point remainder of x / y. The absolute value of the computed value is always less than y 's absolute value and will have the same sign as x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float frexpf (float x, int \*nptr)

Extract mantissa and exponent of a floating-point value.

## Returns

Returns the fractional component m.

- frexp(0, nptr) returns 0 for the fractional component and zero for the integer component.
- frexp(  $\pm 0$ , nptr) returns  $\pm 0$  and stores zero in the location pointed to by nptr.
- ▶ frexp(  $\pm \infty$ , nptr) returns  $\pm \infty$  and stores an unspecified value in the location to which nptr points.
- frexp(NaN, y) returns a NaN and stores an unspecified value in the location to which nptr points.

#### Description

Decomposes the floating-point value x into a component m for the normalized fraction element and another term n for the exponent. The absolute value of m will be greater than or equal to 0.5 and less than 1.0 or it will be equal to 0;  $x = m \cdot 2^n$ . The integer exponent n will be stored in the location to which nptr points.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float \_\_CRTDECL hypotf (float x, float y)

Calculate the square root of the sum of squares of two arguments.

#### Returns

Returns the length of the hypotenuse  $\sqrt{x^2 + y^2}$ . If the correct value would overflow, returns  $+\infty$ . If the correct value would underflow, returns 0.

# Description

Calculates the length of the hypotenuse of a right triangle whose two sides have lengths x and y without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ int ilogbf (float x)

Compute the unbiased integer exponent of the argument.

#### Returns

- ▶ If successful, returns the unbiased exponent of the argument.
- ▶ ilogbf(0) returns INT MIN.
- ▶ ilogbf(NaN) returns NaN.
- ▶ ilogbf(x) returns INT MAX if x is  $\infty$  or the correct value is greater than INT MAX.
- ▶ ilogbf(x) return INT MIN if the correct value is less than INT MIN.

## Description

Calculates the unbiased integer exponent of the input argument x.

hostdeviceRETURN_TYPE isfinite (float a)
Determine whether argument is finite.
Returns
<ul> <li>With Visual Studio 2013 host compiler:RETURN_TYPE is 'bool'. Returns true if and only if a is a finite value.</li> <li>With other host compilers:RETURN_TYPE is 'int'. Returns a nonzero value if and</li> </ul>
only if a is a finite value.
Description
Determine whether the floating-point value a is a finite value (zero, subnormal, or normal and not infinity or NaN).
hostdeviceRETURN_TYPE isinf (float a)  Determine whether argument is infinite.
Returns
▶ With Visual Studio 2013 host compiler:RETURN_TYPE is 'bool'. Returns true if and only if a is a infinite value.
<ul> <li>With other host compilers:RETURN_TYPE is 'int'. Returns a nonzero value if and only if a is a infinite value.</li> </ul>
Description
Determine whether the floating-point value a is an infinite value (positive or negative).
hostdeviceRETURN_TYPE isnan (float a) Determine whether argument is a NaN.
Returns
▶ With Visual Studio 2013 host compiler:RETURN_TYPE is 'bool'. Returns true if and only if a is a NaN value.
<ul> <li>With other host compilers:RETURN_TYPE is 'int'. Returns a nonzero value if and only if a is a NaN value.</li> </ul>

# \_\_host\_\_\_\_device\_\_ float j0f (float x)

Calculate the value of the Bessel function of the first kind of order 0 for the input argument.

#### **Returns**

Returns the value of the Bessel function of the first kind of order 0.

- ▶  $j0f(\pm \infty)$  returns +0.
- ▶ j0f(NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the first kind of order 0 for the input argument x,  $J_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_device\_\_ float j1f (float x)

Calculate the value of the Bessel function of the first kind of order 1 for the input argument.

#### Returns

Returns the value of the Bessel function of the first kind of order 1.

- $j1f(\pm 0)$  returns  $\pm 0$ .
- ▶ j1f(  $\pm \infty$ ) returns +0.
- ▶ j1f(NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the first kind of order 1 for the input argument x,  $J_1(x)$ .

# \_\_host\_\_\_\_device\_\_ float jnf (int n, float x)

Calculate the value of the Bessel function of the first kind of order n for the input argument.

#### **Returns**

Returns the value of the Bessel function of the first kind of order n.

- ▶ jnf(n, NaN) returns NaN.
- $\inf(n, x)$  returns NaN for n < 0.
- ▶  $\inf(n, +\infty)$  returns +0.

## Description

Calculate the value of the Bessel function of the first kind of order n for the input argument x,  $J_n(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float ldexpf (float x, int exp)

Calculate the value of  $x \cdot 2^{exp}$ .

## **Returns**

▶ ldexpf(x) returns  $\pm \infty$  if the correctly calculated value is outside the single floating point range.

# Description

Calculate the value of  $x \cdot 2^{exp}$  of the input arguments x and exp.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_host\_\_\_device\_\_ float lgammaf (float x)

Calculate the natural logarithm of the absolute value of the gamma function of the input argument.

#### Returns

▶ lgammaf(1) returns +0.

- ▶ lgammaf(2) returns +0.
- ▶ lgammaf(x) returns  $\pm \infty$  if the correctly calculated value is outside the single floating point range.
- ▶ lgammaf(x) returns  $+\infty$  if  $x \le 0$ .
- ▶ lgammaf( $-\infty$ ) returns  $-\infty$ .
- ▶ lgammaf(  $+ \infty$ ) returns  $+ \infty$ .

Calculate the natural logarithm of the absolute value of the gamma function of the input argument x, namely the value of  $log_e \int_0^\infty e^{-t} t^{x-1} dt$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ long long int llrintf (float x)

Round input to nearest integer value.

## Returns

Returns rounded integer value.

# Description

Round  $\times$  to the nearest integer value, with halfway cases rounded towards zero. If the result is outside the range of the return type, the result is undefined.

\_\_host\_\_\_\_device\_\_ long long int llroundf (float x)

Round to nearest integer value.

#### Returns

Returns rounded integer value.

## Description

Round x to the nearest integer value, with halfway cases rounded away from zero. If the result is outside the range of the return type, the result is undefined.

This function may be slower than alternate rounding methods. See llrintf().

# \_\_host\_\_\_\_device\_\_ float log10f (float x)

Calculate the base 10 logarithm of the input argument.

#### **Returns**

- ▶  $\log 10f(\pm 0)$  returns  $-\infty$ .
- ightharpoonup log10f(1) returns +0.
- ▶ log10f(x) returns NaN for x < 0.
- ▶  $log10f(+\infty)$  returns  $+\infty$ .

# Description

Calculate the base 10 logarithm of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float log1pf (float x)

Calculate the value of  $log_o(1+x)$ .

#### Returns

- log1pf(  $\pm 0$  ) returns  $-\infty$ .
- $\blacktriangleright$  log1pf(-1) returns +0.
- ▶ log1pf(x) returns NaN for x < -1.
- ▶  $log1pf(+\infty)$  returns  $+\infty$ .

## Description

Calculate the value of  $log_o(1+x)$  of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_host\_\_\_\_device\_\_ float log2f (float x)

Calculate the base 2 logarithm of the input argument.

#### Returns

- ▶  $\log 2f(\pm 0)$  returns  $-\infty$ .
- ightharpoonup log 2f(1) returns +0.

- ▶ log2f(x) returns NaN for x < 0.
- ▶  $\log 2f(+\infty)$  returns  $+\infty$ .

Calculate the base 2 logarithm of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_host\_\_\_device\_ float logbf (float x)

Calculate the floating point representation of the exponent of the input argument.

#### Returns

- ▶ logbf  $\pm 0$  returns  $-\infty$
- ▶  $logbf + \infty returns + \infty$

# Description

Calculate the floating point representation of the exponent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float logf (float x)

Calculate the natural logarithm of the input argument.

#### Returns

- logf(  $\pm 0$  ) returns  $-\infty$ .
- logf(1) returns +0.
- ▶ logf(x) returns NaN for x < 0.
- ▶  $logf(+\infty)$  returns  $+\infty$ .

# Description

Calculate the natural logarithm of the input argument x.

TIOSE GETTEE COILS HILL CHILLE (TOUGH A)	host	device	_ long int	lrintf	(float x)
--	------	--------	------------	--------	-----------

Round input to nearest integer value.

#### Returns

Returns rounded integer value.

# Description

Round  $\times$  to the nearest integer value, with halfway cases rounded towards zero. If the result is outside the range of the return type, the result is undefined.

\_\_host\_\_\_\_device\_\_ long int lroundf (float x)

Round to nearest integer value.

#### Returns

Returns rounded integer value.

# Description

Round  $\times$  to the nearest integer value, with halfway cases rounded away from zero. If the result is outside the range of the return type, the result is undefined.

This function may be slower than alternate rounding methods. See lrintf().

\_\_host\_\_\_\_device\_\_ float modff (float x, float \*iptr)

Break down the input argument into fractional and integral parts.

#### Returns

- modff( $\pm x$ , iptr) returns a result with the same sign as x.
- ▶ modff(  $\pm \infty$ , iptr) returns  $\pm 0$  and stores  $\pm \infty$  in the object pointed to by iptr.
- modff(NaN, iptr) stores a NaN in the object pointed to by iptr and returns a NaN.

#### Description

Break down the argument  $\times$  into fractional and integral parts. The integral part is stored in the argument <code>iptr</code>. Fractional and integral parts are given the same sign as the argument  $\times$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_device\_\_ float nanf (const char \*tagp)

Returns "Not a Number" value.

#### Returns

nanf(tagp) returns NaN.

# Description

Return a representation of a quiet NaN. Argument tagp selects one of the possible representations.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float nearbyintf (float x)

Round the input argument to the nearest integer.

#### Returns

- nearbyintf(  $\pm 0$  ) returns  $\pm 0$ .
- ▶ nearbyintf(  $\pm \infty$ ) returns  $\pm \infty$ .

## Description

Round argument x to an integer value in single precision floating-point format.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_host\_\_\_\_device\_\_ float nextafterf (float x, float y)

Return next representable single-precision floating-point value afer argument.

#### Returns

▶ nextafterf(  $\pm \infty$ , y) returns  $\pm \infty$ .

Calculate the next representable single-precision floating-point value following x in the direction of y. For example, if y is greater than x, nextafterf() returns the smallest representable number greater than x

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float norm3df (float a, float b, float c)

Calculate the square root of the sum of squares of three coordinates of the argument.

#### Returns

Returns the length of the 3D  $\sqrt{p.x^2+p.y^2+p.z^2}$ . If the correct value would overflow, returns  $+\infty$ . If the correct value would underflow, returns 0.

# Description

Calculates the length of three dimensional vector p in euclidean space without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float norm4df (float a, float b, float c, float d)

Calculate the square root of the sum of squares of four coordinates of the argument.

## Returns

Returns the length of the 4D vector  $\sqrt{p.x^2 + p.y^2 + p.z^2 + p.t^2}$ . If the correct value would overflow, returns  $+ \infty$ . If the correct value would underflow, returns 0.

## Description

Calculates the length of four dimensional vector p in euclidean space without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float normcdff (float y)

Calculate the standard normal cumulative distribution function.

#### Returns

- ▶ normcdff(  $+\infty$ ) returns 1
- ▶ normcdff( $-\infty$ ) returns +0

# Description

Calculate the cumulative distribution function of the standard normal distribution for input argument y,  $\Phi(y)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# host device float normcdfinvf (float y)

Calculate the inverse of the standard normal cumulative distribution function.

#### Returns

- ▶ normcdfinvf(0) returns  $-\infty$ .
- ▶ normcdfinvf(1) returns  $+\infty$ .
- normcdfinvf(x) returns NaN if x is not in the interval [0,1].

#### Description

Calculate the inverse of the standard normal cumulative distribution function for input argument y,  $\Phi^{-1}(y)$ . The function is defined for input values in the interval (0, 1).

# \_\_host\_\_\_\_device\_\_ float powf (float x, float y)

Calculate the value of first argument to the power of second argument.

#### Returns

- ▶ powf(  $\pm 0$ , y) returns  $\pm \infty$  for y an integer less than 0.
- powf(  $\pm 0$ , y) returns  $\pm 0$  for y an odd integer greater than 0.
- powf(  $\pm 0$ , y) returns +0 for y > 0 and not and odd integer.
- ▶ powf(-1,  $\pm \infty$ ) returns 1.
- ightharpoonup powf(+1, y) returns 1 for any y, even a NaN.
- powf(x,  $\pm 0$ ) returns 1 for any x, even a NaN.
- powf(x, y) returns a NaN for finite x < 0 and finite non-integer y.
- ▶ powf(x,  $-\infty$ ) returns  $+\infty$  for |x| < 1.
- ▶ powf(x,  $-\infty$ ) returns +0 for |x| > 1.
- ▶ powf(x, +∞) returns +0 for |x| < 1.
- powf(x,  $+\infty$ ) returns  $+\infty$  for |x| > 1.
- ▶ powf( $-\infty$ , y) returns -0 for y an odd integer less than 0.
- ▶ powf( $-\infty$ , y) returns +0 for y < 0 and not an odd integer.
- ▶ powf( $-\infty$ , y) returns  $-\infty$  for y an odd integer greater than 0.
- ▶ powf( $-\infty$ , y) returns  $+\infty$  for y > 0 and not an odd integer.
- ▶ powf(  $+\infty$ , y) returns +0 for y < 0.
- ▶ powf(  $+\infty$ , y) returns  $+\infty$  for y > 0.

### Description

Calculate the value of x to the power of y.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float rcbrtf (float x)

Calculate reciprocal cube root function.

#### Returns

- rcbrt(  $\pm 0$ ) returns  $\pm \infty$ .
- rcbrt(  $\pm \infty$  ) returns  $\pm 0$ .

#### Description

Calculate reciprocal cube root function of x

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float remainderf (float x, float y)

Compute single-precision floating-point remainder.

#### Returns

- remainder f(x, 0) returns NaN.
- ▶ remainderf(  $\pm \infty$ , y) returns NaN.
- remainderf(x,  $\pm \infty$ ) returns x for finite x.

# Description

Compute single-precision floating-point remainder r of dividing x by y for nonzero y. Thus r = x - ny. The value n is the integer value nearest  $\frac{X}{Y}$ . In the case when  $|n - \frac{X}{Y}| = \frac{1}{2}$ , the even n value is chosen.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float remquof (float x, float y, int
\*quo)

Compute single-precision floating-point remainder and part of quotient.

## Returns

Returns the remainder.

- ► remquof(x, 0, quo) returns NaN.
- ▶ remquof(  $\pm \infty$ , y, quo) returns NaN.
- remquof(x,  $\pm \infty$ , quo) returns x.

# Description

Compute a double-precision floating-point remainder in the same way as the remainderf() function. Argument quo returns part of quotient upon division of x by y. Value quo has the same sign as  $\frac{\chi}{y}$  and may not be the exact quotient but agrees with the exact quotient in the low order 3 bits.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float rhypotf (float x, float y)

Calculate one over the square root of the sum of squares of two arguments.

#### **Returns**

Returns one over the length of the hypotenuse  $\frac{1}{\sqrt{x^2+y^2}}$ . If the square root would overflow, returns 0. If the square root would underflow, returns  $+\infty$ .

# Description

Calculates one over the length of the hypotenuse of a right triangle whose two sides have lengths x and y without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float rintf (float x)

Round input to nearest integer value in floating-point.

#### **Returns**

Returns rounded integer value.

# Description

Round x to the nearest integer value in floating-point format, with halfway cases rounded towards zero.

\_\_host\_\_\_\_device\_\_ float rnorm3df (float a, float b, float c)

Calculate one over the square root of the sum of squares of three coordinates of the argument.

#### **Returns**

Returns one over the length of the 3D vector  $\frac{1}{\sqrt{p.x^2+p.y^2+p.z^2}}$ . If the square root would overflow, returns 0. If the square root would underflow, returns  $+\infty$ .

# Description

Calculates one over the length of three dimension vector p in euclidean space without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float roundf (float x)

Round to nearest integer value in floating-point.

#### Returns

Returns rounded integer value.

# Description

Round  $\times$  to the nearest integer value in floating-point format, with halfway cases rounded away from zero.

This function may be slower than alternate rounding methods. See rintf().

\_host\_\_\_\_device\_\_ float rsqrtf (float x)

Calculate the reciprocal of the square root of the input argument.

#### **Returns**

Returns  $1/\sqrt{x}$ .

• rsqrtf(  $+ \infty$  ) returns +0.

- ► rsqrtf(  $\pm 0$ ) returns  $\pm \infty$ .
- rsqrtf(x) returns NaN if x is less than 0.

Calculate the reciprocal of the nonnegative square root of x,  $1/\sqrt{x}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float scalblnf (float x, long int n)

Scale floating-point input by integer power of two.

#### Returns

Returns  $x * 2^n$ .

- scalblnf(  $\pm 0$ , n) returns  $\pm 0$ .
- scalblnf(x, 0) returns x.
- ▶ scalblnf(  $\pm \infty$ , n) returns  $\pm \infty$ .

# Description

Scale  $\times$  by  $2^n$  by efficient manipulation of the floating-point exponent.

\_\_host\_\_\_\_device\_\_ float scalbnf (float x, int n)

Scale floating-point input by integer power of two.

## **Returns**

Returns  $x * 2^n$ .

- scalbnf(  $\pm 0$ , n) returns  $\pm 0$ .
- scalbnf(x, 0) returns x.
- ▶ scalbnf(  $\pm \infty$ , n) returns  $\pm \infty$ .

### Description

Scale  $\times$  by  $2^n$  by efficient manipulation of the floating-point exponent.

host	device	RETURN_	_TYPE	signbit	(float	a)
Return the si	gn bit of the input.					

#### Returns

Reports the sign bit of all values including infinities, zeros, and NaNs.

- With Visual Studio 2013 host compiler: \_\_RETURN\_TYPE is 'bool'. Returns true if and only if a is negative.
- ▶ With other host compilers: \_\_RETURN\_TYPE is 'int'. Returns a nonzero value if and only if a is negative.

# Description

Determine whether the floating-point value a is negative.

\_\_host\_\_\_\_device\_\_ void sincosf (float x, float \*sptr,
float \*cptr)

Calculate the sine and cosine of the first input argument.

#### Returns

none

# Description

Calculate the sine and cosine of the first input argument x (measured in radians). The results for sine and cosine are written into the second argument, sptr, and, respectively, third argument, cptr.

#### See also:

sinf() and cosf().

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ void sincospif (float x, float \*sptr, float \*cptr)

Calculate the sine and cosine of the first input argument  $\times \pi$ .

#### **Returns**

none

## Description

Calculate the sine and cosine of the first input argument, x (measured in radians), x  $\pi$ . The results for sine and cosine are written into the second argument, sptr, and, respectively, third argument, cptr.

#### See also:

sinpif() and cospif().

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_device\_\_ float sinf (float x)

Calculate the sine of the input argument.

## Returns

- $\blacktriangleright$  sinf(  $\pm 0$  ) returns  $\pm 0$ .
- ▶  $sinf(\pm \infty)$  returns NaN.

# Description

Calculate the sine of the input argument x (measured in radians).

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

# \_\_host\_\_\_\_device\_\_ float sinhf (float x)

Calculate the hyperbolic sine of the input argument.

#### Returns

- $\sinh(\pm 0)$  returns  $\pm 0$ .
- ▶  $\sinh(\pm \infty)$  returns NaN.

# Description

Calculate the hyperbolic sine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float sinpif (float x)

Calculate the sine of the input argument  $\times \pi$ .

## Returns

- sinpif(  $\pm 0$  ) returns  $\pm 0$ .
- ▶ sinpif(  $\pm \infty$ ) returns NaN.

# Description

Calculate the sine of  $x \times \pi$  (measured in radians), where x is the input argument.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_device\_\_ float sqrtf (float x)

Calculate the square root of the input argument.

#### Returns

Returns  $\sqrt{x}$ .

- sqrtf(  $\pm 0$  ) returns  $\pm 0$ .
- ▶ sqrtf(  $+\infty$ ) returns  $+\infty$ .
- $\operatorname{sqrtf}(x)$  returns NaN if x is less than 0.

Calculate the nonnegative square root of x,  $\sqrt{x}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float tanf (float x)

Calculate the tangent of the input argument.

#### Returns

- ▶  $tanf(\pm 0)$  returns  $\pm 0$ .
- ▶  $tanf(\pm \infty)$  returns NaN.

# Description

Calculate the tangent of the input argument x (measured in radians).

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This function is affected by the --use\_fast\_math compiler flag. See the CUDA C Programming Guide, Appendix D.2, Table 8 for a complete list of functions affected.

\_\_host\_\_\_\_device\_\_ float tanhf (float x)

Calculate the hyperbolic tangent of the input argument.

#### Returns

•  $\tanh f(\pm 0)$  returns  $\pm 0$ .

### Description

Calculate the hyperbolic tangent of the input argument x.

# \_\_host\_\_\_\_device\_\_ float tgammaf (float x)

Calculate the gamma function of the input argument.

#### Returns

- ▶ tgammaf(  $\pm 0$ ) returns  $\pm \infty$ .
- ▶ tgammaf(2) returns +0.
- ▶ tgammaf(x) returns  $\pm \infty$  if the correctly calculated value is outside the single floating point range.
- tgammaf(x) returns NaN if x < 0.
- ▶ tgammaf(  $-\infty$ ) returns NaN.
- ▶ tgammaf(  $+\infty$ ) returns  $+\infty$ .

# Description

Calculate the gamma function of the input argument  $\times$ , namely the value of  $\int_0^\infty e^{-t}t^{x-1}dt$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ float truncf (float x)

Truncate input argument to the integral part.

#### Returns

Returns truncated integer value.

### Description

Round x to the nearest integer value that does not exceed x in magnitude.

# \_\_host\_\_\_\_device\_\_ float y0f (float x)

Calculate the value of the Bessel function of the second kind of order 0 for the input argument.

#### **Returns**

Returns the value of the Bessel function of the second kind of order 0.

- ▶ y0f(0) returns  $-\infty$ .
- y0f(x) returns NaN for x < 0.
- ▶  $y0f(+\infty)$  returns +0.

▶ y0f(NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the second kind of order 0 for the input argument  $\times$ ,  $Y_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float y1f (float x)

Calculate the value of the Bessel function of the second kind of order 1 for the input argument.

#### Returns

Returns the value of the Bessel function of the second kind of order 1.

- ▶ y1f(0) returns  $-\infty$ .
- ▶ y1f(x) returns NaN for x < 0.
- ▶  $y1f(+\infty)$  returns +0.
- ▶ y1f(NaN) returns NaN.

## Description

Calculate the value of the Bessel function of the second kind of order 1 for the input argument x,  $Y_1(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_host\_\_\_\_device\_\_ float ynf (int n, float x)

Calculate the value of the Bessel function of the second kind of order n for the input argument.

#### Returns

Returns the value of the Bessel function of the second kind of order n.

- ynf(n, x) returns NaN for n < 0.
- ▶ ynf(n, 0) returns  $-\infty$ .
- ynf(n, x) returns NaN for x < 0.
- ▶  $ynf(n, +\infty)$  returns +0.

ynf(n, NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the second kind of order n for the input argument x,  $Y_n(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# 1.3. Double Precision Mathematical Functions

This section describes double precision mathematical functions.

\_\_host\_\_\_\_device\_\_ double acos (double x)

Calculate the arc cosine of the input argument.

#### Returns

Result will be in radians, in the interval  $[0, \pi]$  for x inside [-1, +1].

- acos(1) returns +0.
- acos(x) returns NaN for x outside [-1, +1].

### Description

Calculate the principal value of the arc cosine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double acosh (double x)

Calculate the nonnegative arc hyperbolic cosine of the input argument.

#### Returns

Result will be in the interval  $[0, +\infty]$ .

- acosh(1) returns 0.
- ▶  $a\cosh(x)$  returns NaN for x in the interval  $[-\infty, 1)$ .

Calculate the nonnegative arc hyperbolic cosine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_device\_ double asin (double x)

Calculate the arc sine of the input argument.

## Returns

Result will be in radians, in the interval  $[-\pi/2, +\pi/2]$  for x inside [-1, +1].

- ightharpoonup asin(0) returns +0.
- asin(x) returns NaN for x outside [-1, +1].

# Description

Calculate the principal value of the arc sine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double asinh (double x)

Calculate the arc hyperbolic sine of the input argument.

#### Returns

asinh(0) returns 1.

# Description

Calculate the arc hyperbolic sine of the input argument x.

# \_\_host\_\_\_\_device\_\_ double atan (double x)

Calculate the arc tangent of the input argument.

#### Returns

Result will be in radians, in the interval  $[-\pi/2, +\pi/2]$ .

ightharpoonup atan(0) returns +0.

# Description

Calculate the principal value of the arc tangent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_device\_\_ double atan2 (double y, double x)

Calculate the arc tangent of the ratio of first and second input arguments.

#### Returns

Result will be in radians, in the interval  $[-\pi/, +\pi]$ .

▶ atan2(0, 1) returns +0.

## Description

Calculate the principal value of the arc tangent of the ratio of first and second input arguments y / x. The quadrant of the result is determined by the signs of inputs y and x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double atanh (double x)

Calculate the arc hyperbolic tangent of the input argument.

## Returns

- atanh(  $\pm 0$ ) returns  $\pm 0$ .
- ▶ atanh(  $\pm 1$ ) returns  $\pm \infty$ .
- ▶ atanh(x) returns NaN for x outside interval [-1, 1].

Calculate the arc hyperbolic tangent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_\_device\_\_ double cbrt (double x)

Calculate the cube root of the input argument.

### **Returns**

Returns  $x^{1/3}$ .

- cbrt(  $\pm 0$ ) returns  $\pm 0$ .
- ▶ cbrt(  $\pm \infty$ ) returns  $\pm \infty$ .

# Description

Calculate the cube root of x,  $x^{1/3}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double ceil (double x)

Calculate ceiling of the input argument.

#### Returns

Returns  $\Box x \Box$  expressed as a floating-point number.

- ceil(  $\pm 0$ ) returns  $\pm 0$ .
- ceil(  $\pm \infty$ ) returns  $\pm \infty$ .

### Description

Compute the smallest integer value not less than x.

Create value with given magnitude, copying sign of second value.

### **Returns**

Returns a value with the magnitude of x and the sign of y.

## Description

Create a floating-point value with the magnitude  $\mathbf{x}$  and the sign of  $\mathbf{y}$ .

\_\_host\_\_\_\_device\_\_ double cos (double x)

Calculate the cosine of the input argument.

#### Returns

- ightharpoonup cos(  $\pm 0$  ) returns 1.
- ▶  $cos(\pm \infty)$  returns NaN.

# Description

Calculate the cosine of the input argument x (measured in radians).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double cosh (double x)

Calculate the hyperbolic cosine of the input argument.

#### Returns

- ightharpoonup cosh(0) returns 1.
- ▶  $\cosh(\pm \infty)$  returns  $+ \infty$ .

## Description

Calculate the hyperbolic cosine of the input argument x.

# \_\_host\_\_\_\_device\_\_ double cospi (double x)

Calculate the cosine of the input argument  $\times \pi$ .

#### Returns

- $cospi(\pm 0)$  returns 1.
- ▶  $cospi(\pm \infty)$  returns NaN.

# Description

Calculate the cosine of  $x \times \pi$  (measured in radians), where x is the input argument.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double cyl\_bessel\_i0 (double x)

Calculate the value of the regular modified cylindrical Bessel function of order 0 for the input argument.

#### **Returns**

Returns the value of the regular modified cylindrical Bessel function of order 0.

# Description

Calculate the value of the regular modified cylindrical Bessel function of order 0 for the input argument x,  $I_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double cyl\_bessel\_i1 (double x)

Calculate the value of the regular modified cylindrical Bessel function of order 1 for the input argument.

## Returns

Returns the value of the regular modified cylindrical Bessel function of order 1.

Calculate the value of the regular modified cylindrical Bessel function of order 1 for the input argument  $\times$ ,  $I_1(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double erf (double x)

Calculate the error function of the input argument.

### **Returns**

- erf(  $\pm 0$  ) returns  $\pm 0$ .
- erf(  $\pm \infty$ ) returns  $\pm 1$ .

# Description

Calculate the value of the error function for the input argument  $\times$ ,  $\frac{2}{\sqrt{\pi}} \int_{0}^{x} e^{-t^2} dt$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double erfc (double x)

Calculate the complementary error function of the input argument.

#### Returns

- erfc( $-\infty$ ) returns 2.
- erfc(  $+\infty$ ) returns +0.

### **Description**

Calculate the complementary error function of the input argument x, 1 - erf(x).

# \_\_host\_\_\_\_device\_\_ double erfcinv (double y)

Calculate the inverse complementary error function of the input argument.

#### Returns

- erfcinv(0) returns  $+\infty$ .
- erfcinv(2) returns  $-\infty$ .

# Description

Calculate the inverse complementary error function of the input argument y, for y in the interval [0, 2]. The inverse complementary error function find the value x that satisfies the equation  $y = \operatorname{erfc}(x)$ , for  $0 \le y \le 2$ , and  $-\infty \le x \le \infty$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double erfcx (double x)

Calculate the scaled complementary error function of the input argument.

#### Returns

- erfcx( $-\infty$ ) returns  $+\infty$
- erfcx(  $+\infty$ ) returns +0
- erfcx(x) returns  $+\infty$  if the correctly calculated value is outside the double floating point range.

### Description

Calculate the scaled complementary error function of the input argument x,  $e^{x^2}$  erfc(x).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_host\_\_\_\_device\_\_ double erfinv (double y)

Calculate the inverse error function of the input argument.

# Returns

- erfinv(1) returns  $+\infty$ .
- erfinv(-1) returns  $-\infty$ .

Calculate the inverse error function of the input argument y, for y in the interval [-1, 1]. The inverse error function finds the value x that satisfies the equation y = erf(x), for  $-1 \le y \le 1$ , and  $-\infty \le x \le \infty$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double exp (double x)

Calculate the base *e* exponential of the input argument.

#### Returns

Returns  $e^{x}$ .

# Description

Calculate the base e exponential of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_device\_\_ double exp10 (double x)

Calculate the base 10 exponential of the input argument.

#### **Returns**

Returns 10<sup>x</sup>.

# **Description**

Calculate the base 10 exponential of the input argument x.

# \_\_host\_\_\_\_device\_\_ double exp2 (double x)

Calculate the base 2 exponential of the input argument.

#### Returns

Returns  $2^x$ .

# Description

Calculate the base 2 exponential of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double expm1 (double x)

Calculate the base *e* exponential of the input argument, minus 1.

#### Returns

Returns  $e^{x} - 1$ .

# Description

Calculate the base e exponential of the input argument x, minus 1.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_device\_\_ double fabs (double x)

Calculate the absolute value of the input argument.

# Returns

Returns the absolute value of the input argument.

- ▶ fabs(  $\pm \infty$ ) returns  $+ \infty$ .
- fabs(  $\pm 0$  ) returns 0.

# Description

Calculate the absolute value of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_host\_\_\_\_device\_\_ double fdim (double x, double y)

Compute the positive difference between  $\boldsymbol{x}$  and  $\boldsymbol{y}$ .

#### Returns

Returns the positive difference between x and y.

- fdim(x, y) returns x y if x > y.
- fdim(x, y) returns +0 if  $x \le y$ .

# Description

Compute the positive difference between x and y. The positive difference is x - y when x > y and +0 otherwise.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_host\_\_\_\_device\_\_ double floor (double x)

Calculate the largest integer less than or equal to x.

#### Returns

Returns  $log_a(1+x)$  expressed as a floating-point number.

- floor(  $\pm \infty$ ) returns  $\pm \infty$ .
- floor(  $\pm 0$  ) returns  $\pm 0$ .

## Description

Calculates the largest integer value which is less than or equal to x.

# \_\_host\_\_\_\_device\_\_ double fma (double x, double y, double z)

Compute  $x \times y + z$  as a single operation.

#### Returns

Returns the rounded value of  $x \times y + z$  as a single operation.

- fma(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- fma(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fma(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fma(x, y, +∞) returns NaN if  $x \times y$  is an exact  $-\infty$ .

## Description

Compute the value of  $x \times y + z$  as a single ternary operation. After computing the value to infinite precision, the value is rounded once.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double fmax (double, double)

Determine the maximum numeric value of the arguments.

#### **Returns**

Returns the maximum numeric values of the arguments x and y.

- If both arguments are NaN, returns NaN.
- ▶ If one argument is NaN, returns the numeric argument.

#### Description

Determines the maximum numeric value of the arguments x and y. Treats NaN arguments as missing data. If one argument is a NaN and the other is legitimate numeric value, the numeric value is chosen.

# \_\_host\_\_\_\_device\_\_ double fmin (double x, double y)

Determine the minimum numeric value of the arguments.

#### Returns

Returns the minimum numeric values of the arguments x and y.

- If both arguments are NaN, returns NaN.
- ▶ If one argument is NaN, returns the numeric argument.

# **Description**

Determines the minimum numeric value of the arguments x and y. Treats NaN arguments as missing data. If one argument is a NaN and the other is legitimate numeric value, the numeric value is chosen.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double fmod (double x, double y)

Calculate the floating-point remainder of x / y.

#### Returns

- Returns the floating point remainder of x / y.
- fmod(  $\pm 0$ , y) returns  $\pm 0$  if y is not zero.
- ▶ fmod(x, y) returns NaN and raised an invalid floating point exception if x is  $\pm \infty$  or y is zero.
- fmod(x, y) returns zero if y is zero or the result would overflow.
- ▶ fmod(x,  $\pm \infty$ ) returns x if x is finite.
- fmod(x, 0) returns NaN.

### Description

Calculate the floating-point remainder of x / y. The absolute value of the computed value is always less than y 's absolute value and will have the same sign as x.

# \_\_host\_\_\_\_device\_\_ double frexp (double x, int \*nptr)

Extract mantissa and exponent of a floating-point value.

#### Returns

Returns the fractional component m.

- frexp(0, nptr) returns 0 for the fractional component and zero for the integer component.
- frexp( $\pm 0$ , nptr) returns  $\pm 0$  and stores zero in the location pointed to by nptr.
- ▶ frexp(  $\pm \infty$ , nptr) returns  $\pm \infty$  and stores an unspecified value in the location to which nptr points.
- frexp(NaN, y) returns a NaN and stores an unspecified value in the location to which nptr points.

## Description

Decompose the floating-point value x into a component m for the normalized fraction element and another term n for the exponent. The absolute value of m will be greater than or equal to 0.5 and less than 1.0 or it will be equal to 0;  $x = m \cdot 2^n$ . The integer exponent n will be stored in the location to which nptr points.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double \_\_CRTDECL hypot (double x, double y)

Calculate the square root of the sum of squares of two arguments.

#### Returns

Returns the length of the hypotenuse  $\sqrt{x^2 + y^2}$ . If the correct value would overflow, returns  $+\infty$ . If the correct value would underflow, returns 0.

#### Description

Calculate the length of the hypotenuse of a right triangle whose two sides have lengths x and y without undue overflow or underflow.

# \_\_host\_\_\_\_device\_\_ int ilogb (double x)

Compute the unbiased integer exponent of the argument.

#### **Returns**

- ▶ If successful, returns the unbiased exponent of the argument.
- ▶ ilogb(0) returns INT MIN.
- ▶ ilogb(NaN) returns NaN.
- ▶ ilogb(x) returns INT\_MAX if x is  $\infty$  or the correct value is greater than INT\_MAX.
- ▶ ilogb(x) return INT\_MIN if the correct value is less than INT\_MIN.

## Description

Calculates the unbiased integer exponent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ \_\_RETURN\_TYPE isfinite (double a)

Determine whether argument is finite.

#### Returns

- ▶ With Visual Studio 2013 host compiler: \_\_RETURN\_TYPE is 'bool'. Returns true if and only if a is a finite value.
- ▶ With other host compilers: \_\_RETURN\_TYPE is 'int'. Returns a nonzero value if and only if a is a finite value.

## Description

Determine whether the floating-point value a is a finite value (zero, subnormal, or normal and not infinity or NaN).

\_\_host\_\_\_\_device\_\_ \_\_RETURN\_TYPE isinf (double a)

Determine whether argument is infinite.

#### Returns

- ▶ With Visual Studio 2013 host compiler: Returns true if and only if a is a infinite value.
- With other host compilers: Returns a nonzero value if and only if a is a infinite value.

Determine whether the floating-point value a is an infinite value (positive or negative).

\_\_host\_\_\_\_device\_\_ \_\_RETURN\_TYPE isnan (double a)

Determine whether argument is a NaN.

#### Returns

- ▶ With Visual Studio 2013 host compiler: \_\_RETURN\_TYPE is 'bool'. Returns true if and only if a is a NaN value.
- ▶ With other host compilers: \_\_RETURN\_TYPE is 'int'. Returns a nonzero value if and only if a is a NaN value.

## Description

Determine whether the floating-point value a is a NaN.

\_\_host\_\_\_\_device\_\_ double j0 (double x)

Calculate the value of the Bessel function of the first kind of order 0 for the input argument.

#### **Returns**

Returns the value of the Bessel function of the first kind of order 0.

- ▶  $i0(\pm \infty)$  returns +0.
- ▶ j0(NaN) returns NaN.

## Description

Calculate the value of the Bessel function of the first kind of order 0 for the input argument x,  $J_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_\_device\_\_ double j1 (double x)

Calculate the value of the Bessel function of the first kind of order 1 for the input argument.

#### **Returns**

Returns the value of the Bessel function of the first kind of order 1.

- $j1(\pm 0)$  returns  $\pm 0$ .
- ▶  $j1(\pm \infty)$  returns +0.
- ▶ j1(NaN) returns NaN.

Calculate the value of the Bessel function of the first kind of order 1 for the input argument x,  $J_1(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_\_device\_\_ double jn (int n, double x)

Calculate the value of the Bessel function of the first kind of order n for the input argument.

#### Returns

Returns the value of the Bessel function of the first kind of order n.

- ▶ jn(n, NaN) returns NaN.
- jn(n, x) returns NaN for n < 0.
- ▶  $jn(n, +\infty)$  returns +0.

## Description

Calculate the value of the Bessel function of the first kind of order n for the input argument x,  $J_n(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double ldexp (double x, int exp)

Calculate the value of  $x \cdot 2^{exp}$ .

#### **Returns**

▶ ldexp(x) returns  $\pm \infty$  if the correctly calculated value is outside the double floating point range.

# **Description**

Calculate the value of  $x \cdot 2^{exp}$  of the input arguments x and exp.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double lgamma (double x)

Calculate the natural logarithm of the absolute value of the gamma function of the input argument.

#### **Returns**

- ▶ lgamma(1) returns +0.
- ▶ lgamma(2) returns +0.
- ▶ lgamma(x) returns  $\pm \infty$  if the correctly calculated value is outside the double floating point range.
- ▶ lgamma(x) returns  $+\infty$  if  $x \le 0$ .
- ▶ lgamma( $-\infty$ ) returns  $-\infty$ .
- ▶ lgamma(  $+ \infty$ ) returns  $+ \infty$ .

## Description

Calculate the natural logarithm of the absolute value of the gamma function of the input argument x, namely the value of  $\log_e \left| \int_0^\infty e^{-t} t^{x-1} dt \right|$ 

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ long long int llrint (double x)

Round input to nearest integer value.

#### Returns

Returns rounded integer value.

## Description

Round x to the nearest integer value, with halfway cases rounded towards zero. If the result is outside the range of the return type, the result is undefined.

\_\_host\_\_\_\_device\_\_ long long int llround (double x)

Round to nearest integer value.

#### Returns

Returns rounded integer value.

# Description

Round x to the nearest integer value, with halfway cases rounded away from zero. If the result is outside the range of the return type, the result is undefined.

This function may be slower than alternate rounding methods. See llrint().

\_\_host\_\_\_\_device\_\_ double log (double x)

Calculate the base *e* logarithm of the input argument.

#### Returns

- log(  $\pm 0$ ) returns  $-\infty$ .
- ightharpoonup log(1) returns +0.
- ▶ log(x) returns NaN for x < 0.
- ▶  $\log(+\infty)$  returns  $+\infty$

### Description

Calculate the base e logarithm of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_device\_ double log10 (double x)

Calculate the base 10 logarithm of the input argument.

#### **Returns**

- ▶  $\log 10(\pm 0)$  returns  $-\infty$ .
- ▶ log10(1) returns +0.
- ▶ log10(x) returns NaN for x < 0.
- ▶  $\log 10(+\infty)$  returns  $+\infty$ .

Calculate the base 10 logarithm of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_\_device\_\_ double log1p (double x)

Calculate the value of  $log_o(1+x)$ .

#### Returns

- log1p(  $\pm 0$  ) returns  $-\infty$ .
- ightharpoonup log1p(-1) returns +0.
- ▶ log1p(x) returns NaN for x < -1.
- ▶  $log1p(+\infty)$  returns  $+\infty$ .

## Description

Calculate the value of  $log_o(1+x)$  of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double log2 (double x)

Calculate the base 2 logarithm of the input argument.

## Returns

- ▶  $\log 2(\pm 0)$  returns  $-\infty$ .
- $\blacktriangleright$  log2(1) returns +0.
- ▶ log2(x) returns NaN for x < 0.
- ▶  $\log 2(+\infty)$  returns  $+\infty$ .

### Description

Calculate the base 2 logarithm of the input argument x.

\_\_host\_\_\_\_device\_\_ double logb (double x)

Calculate the floating point representation of the exponent of the input argument.

#### Returns

- ▶ logb  $\pm 0$  returns  $-\infty$
- ▶ logb  $\pm \infty$  returns  $+ \infty$

# Description

Calculate the floating point representation of the exponent of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_host\_\_\_\_device\_\_ long int lrint (double x)

Round input to nearest integer value.

#### Returns

Returns rounded integer value.

#### Description

Round x to the nearest integer value, with halfway cases rounded towards zero. If the result is outside the range of the return type, the result is undefined.

\_\_host\_\_\_\_device\_\_ long int lround (double x)

Round to nearest integer value.

#### **Returns**

Returns rounded integer value.

### Description

Round  $\times$  to the nearest integer value, with halfway cases rounded away from zero. If the result is outside the range of the return type, the result is undefined.

This function may be slower than alternate rounding methods. See lrint().

# \_\_host\_\_\_\_device\_\_ double modf (double x, double \*iptr)

Break down the input argument into fractional and integral parts.

#### Returns

- modf( $\pm x$ , iptr) returns a result with the same sign as x.
- ▶ modf(  $\pm \infty$ , iptr) returns  $\pm 0$  and stores  $\pm \infty$  in the object pointed to by iptr.
- modf(NaN, iptr) stores a NaN in the object pointed to by iptr and returns a NaN.

# Description

Break down the argument x into fractional and integral parts. The integral part is stored in the argument iptr. Fractional and integral parts are given the same sign as the argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_device\_\_ double nan (const char \*tagp)

Returns "Not a Number" value.

#### Returns

nan(tagp) returns NaN.

#### Description

Return a representation of a quiet NaN. Argument tagp selects one of the possible representations.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double nearbyint (double x)

Round the input argument to the nearest integer.

#### Returns

- nearbyint(  $\pm 0$ ) returns  $\pm 0$ .
- ▶ nearbyint(  $\pm \infty$ ) returns  $\pm \infty$ .

Round argument x to an integer value in double precision floating-point format.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double nextafter (double x, double
y)

Return next representable double-precision floating-point value after argument.

#### **Returns**

▶ nextafter(  $\pm \infty$ , y) returns  $\pm \infty$ .

# Description

Calculate the next representable double-precision floating-point value following x in the direction of y. For example, if y is greater than x, nextafter() returns the smallest representable number greater than x

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double norm3d (double a, double b, double c)

Calculate the square root of the sum of squares of three coordinates of the argument.

#### **Returns**

Returns the length of 3D vector  $\sqrt{\mathbf{p}.\mathbf{x}^2 + \mathbf{p}.\mathbf{y}^2 + \mathbf{p}.\mathbf{z}^2}$ . If the correct value would overflow, returns  $+\infty$ . If the correct value would underflow, returns 0.

## Description

Calculate the length of three dimensional vector p in euclidean space without undue overflow or underflow.

# \_\_host\_\_\_\_device\_\_ double norm4d (double a, double b, double c, double d)

Calculate the square root of the sum of squares of four coordinates of the argument.

### **Returns**

Returns the length of 4D vector  $\sqrt{p.x^2 + p.y^2 + p.z^2 + p.t^2}$ . If the correct value would overflow, returns  $+ \infty$ . If the correct value would underflow, returns 0.

# Description

Calculate the length of four dimensional vector p in euclidean space without undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double normcdf (double y)

Calculate the standard normal cumulative distribution function.

#### Returns

- ▶ normcdf(  $+\infty$ ) returns 1
- ▶ normcdf( $-\infty$ ) returns +0

### Description

Calculate the cumulative distribution function of the standard normal distribution for input argument y,  $\Phi(y)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double normcdfinv (double y)

Calculate the inverse of the standard normal cumulative distribution function.

#### Returns

- ▶ normcdfinv(0) returns  $-\infty$ .
- ▶ normcdfinv(1) returns  $+\infty$ .
- normcdfinv(x) returns NaN if x is not in the interval [0,1].

Calculate the inverse of the standard normal cumulative distribution function for input argument y,  $\Phi^{-1}(y)$ . The function is defined for input values in the interval (0, 1).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_host\_\_\_\_device\_\_ double pow (double x, double y)

Calculate the value of first argument to the power of second argument.

#### Returns

- ▶ pow(  $\pm 0$ , y) returns  $\pm \infty$  for y an integer less than 0.
- ightharpoonup pow(  $\pm 0$ , y) returns  $\pm 0$  for y an odd integer greater than 0.
- pow( $\pm 0$ , y) returns +0 for y > 0 and not and odd integer.
- ▶ pow(-1,  $\pm \infty$ ) returns 1.
- ▶ pow(+1, y) returns 1 for any y, even a NaN.
- pow(x,  $\pm 0$ ) returns 1 for any x, even a NaN.
- $\triangleright$  pow(x, y) returns a NaN for finite x < 0 and finite non-integer y.
- ▶ pow(x,  $-\infty$ ) returns  $+\infty$  for |x| < 1.
- ▶ pow(x,  $-\infty$ ) returns +0 for |x| > 1.
- ▶ pow(x, +∞) returns +0 for |x| < 1.
- $\triangleright$  pow(x, +\infty) returns +\infty for |x| > 1.
- ▶ pow( $-\infty$ , y) returns -0 for y an odd integer less than 0.
- ▶ pow( $-\infty$ , y) returns +0 for y < 0 and not an odd integer.
- ▶ pow( $-\infty$ , y) returns  $-\infty$  for y an odd integer greater than 0.
- ▶ pow( $-\infty$ , y) returns  $+\infty$  for y > 0 and not an odd integer.
- ▶ pow(  $+ \infty$ , y) returns +0 for y < 0.
- ▶ pow(  $+\infty$ , y) returns  $+\infty$  for y > 0.

#### Description

Calculate the value of x to the power of y

\_\_host\_\_\_\_device\_\_ double rcbrt (double x)

Calculate reciprocal cube root function.

#### Returns

- rcbrt(  $\pm 0$ ) returns  $\pm \infty$ .
- ▶ rcbrt(  $\pm \infty$ ) returns  $\pm 0$ .

# Description

Calculate reciprocal cube root function of x

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double remainder (double x, double y)

Compute double-precision floating-point remainder.

#### Returns

- remainder(x, 0) returns NaN.
- remainder(  $\pm \infty$ , y) returns NaN.
- remainder( $x, \pm \infty$ ) returns x for finite x.

## Description

Compute double-precision floating-point remainder r of dividing x by y for nonzero y. Thus r = x - ny. The value n is the integer value nearest  $\frac{X}{y}$ . In the case when  $|n - \frac{X}{y}| = \frac{1}{2}$ , the even n value is chosen.

# \_\_host\_\_\_\_device\_\_ double remquo (double x, double y, int \*quo)

Compute double-precision floating-point remainder and part of quotient.

### Returns

Returns the remainder.

- ► remquo(x, 0, quo) returns NaN.
- remquo(  $\pm \infty$ , y, quo) returns NaN.
- remquo(x,  $\pm \infty$ , quo) returns x.

## Description

Compute a double-precision floating-point remainder in the same way as the remainder() function. Argument quo returns part of quotient upon division of x by y. Value quo has the same sign as  $\frac{X}{Y}$  and may not be the exact quotient but agrees with the exact quotient in the low order 3 bits.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double rhypot (double x, double y)

Calculate one over the square root of the sum of squares of two arguments.

## Returns

Returns one over the length of the hypotenuse  $\frac{1}{\sqrt{x^2+y^2}}$ . If the square root would overflow, returns 0. If the square root would underflow, returns  $+\infty$ .

### Description

Calculate one over the length of the hypotenuse of a right triangle whose two sides have lengths x and y without undue overflow or underflow.

	host	device	double rint (	(double x)
--	------	--------	---------------	------------

Round to nearest integer value in floating-point.

#### Returns

Returns rounded integer value.

# Description

Round  $\times$  to the nearest integer value in floating-point format, with halfway cases rounded to the nearest even integer value.

# \_\_host\_\_\_\_device\_\_ double rnorm3d (double a, double b, double c)

Calculate one over the square root of the sum of squares of three coordinates of the argument.

#### **Returns**

Returns one over the length of the 3D vetor  $\frac{1}{\sqrt{p.x^2+p.y^2+p.z^2}}$ . If the square root would overflow, returns 0. If the square root would underflow, returns  $+\infty$ .

# Description

Calculate one over the length of three dimensional vector p in euclidean space undue overflow or underflow.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

host device double round (double x)

Round to nearest integer value in floating-point.

#### Returns

Returns rounded integer value.

# Description

Round x to the nearest integer value in floating-point format, with halfway cases rounded away from zero.

This function may be slower than alternate rounding methods. See rint().

# \_\_host\_\_\_\_device\_\_ double rsqrt (double x)

Calculate the reciprocal of the square root of the input argument.

#### **Returns**

Returns  $1/\sqrt{x}$ .

- ▶ rsqrt(  $+ \infty$ ) returns +0.
- rsqrt(  $\pm 0$ ) returns  $\pm \infty$ .
- rsqrt(x) returns NaN if x is less than 0.

# Description

Calculate the reciprocal of the nonnegative square root of x,  $1/\sqrt{x}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double scalbln (double x, long int n)

Scale floating-point input by integer power of two.

#### Returns

Returns  $\times * 2^n$ .

- scalbln(  $\pm 0$ , n) returns  $\pm 0$ .
- $\triangleright$  scalbln(x, 0) returns x.
- ▶ scalbln(  $\pm \infty$ , n) returns  $\pm \infty$ .

# Description

Scale  $\times$  by  $2^n$  by efficient manipulation of the floating-point exponent.

# \_\_host\_\_\_\_device\_\_ double scalbn (double x, int n)

Scale floating-point input by integer power of two.

### Returns

Returns  $x * 2^n$ .

- scalbn(  $\pm 0$ , n) returns  $\pm 0$ .
- ightharpoonup scalbn(x, 0) returns x.
- ▶ scalbn(  $\pm \infty$ , n) returns  $\pm \infty$ .

## Description

Scale  $\times$  by  $2^n$  by efficient manipulation of the floating-point exponent.

\_\_host\_\_\_\_device\_\_ \_\_RETURN\_TYPE signbit (double a)

Return the sign bit of the input.

#### Returns

Reports the sign bit of all values including infinities, zeros, and NaNs.

- ▶ With Visual Studio 2013 host compiler: \_\_RETURN\_TYPE is 'bool'. Returns true if and only if a is negative.
- ▶ With other host compilers: \_\_RETURN\_TYPE is 'int'. Returns a nonzero value if and only if a is negative.

## Description

Determine whether the floating-point value a is negative.

\_\_host\_\_\_\_device\_\_ double sin (double x)

Calculate the sine of the input argument.

#### Returns

- $\rightarrow$  sin(  $\pm 0$  ) returns  $\pm 0$ .
- ▶  $\sin(\pm \infty)$  returns NaN.

### Description

Calculate the sine of the input argument x (measured in radians).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ void sincos (double x, double \*sptr, double \*cptr)

Calculate the sine and cosine of the first input argument.

#### Returns

none

# Description

Calculate the sine and cosine of the first input argument x (measured in radians). The results for sine and cosine are written into the second argument, sptr, and, respectively, third argument, cptr.

#### See also:

sin() and cos().

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ void sincospi (double x, double \*sptr, double \*cptr)

Calculate the sine and cosine of the first input argument  $\times \pi$ .

#### Returns

none

#### Description

Calculate the sine and cosine of the first input argument, x (measured in radians), x  $\pi$ . The results for sine and cosine are written into the second argument, sptr, and, respectively, third argument, cptr.

#### See also:

sinpi() and cospi().

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double sinh (double x)

Calculate the hyperbolic sine of the input argument.

#### Returns

•  $\sinh(\pm 0)$  returns  $\pm 0$ .

# Description

Calculate the hyperbolic sine of the input argument x.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double sinpi (double x)

Calculate the sine of the input argument  $\times \pi$ .

### **Returns**

- $sinpi(\pm 0)$  returns  $\pm 0$ .
- ▶  $sinpi(\pm \infty)$  returns NaN.

### Description

Calculate the sine of  $x \times \pi$  (measured in radians), where x is the input argument.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_host\_\_\_\_device\_\_ double sqrt (double x)

Calculate the square root of the input argument.

#### Returns

Returns  $\sqrt{x}$ .

• sqrt(  $\pm 0$  ) returns  $\pm 0$ .

- sqrt(  $+\infty$  ) returns  $+\infty$ .
- $\operatorname{sqrt}(x)$  returns NaN if x is less than 0.

Calculate the nonnegative square root of x,  $\sqrt{x}$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_device\_\_double tan (double x)

Calculate the tangent of the input argument.

#### Returns

- ▶  $tan(\pm 0)$  returns  $\pm 0$ .
- ▶  $tan(\pm \infty)$  returns NaN.

## Description

Calculate the tangent of the input argument x (measured in radians).

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_device\_\_ double tanh (double x)

Calculate the hyperbolic tangent of the input argument.

#### Returns

tanh(  $\pm 0$ ) returns  $\pm 0$ .

### Description

Calculate the hyperbolic tangent of the input argument x.

# \_\_host\_\_\_\_device\_\_ double tgamma (double x)

Calculate the gamma function of the input argument.

#### Returns

- ▶ tgamma(  $\pm 0$ ) returns  $\pm \infty$ .
- ▶ tgamma(2) returns +0.
- tgamma(x) returns  $\pm \infty$  if the correctly calculated value is outside the double floating point range.
- tgamma(x) returns NaN if x < 0.
- ▶ tgamma( $-\infty$ ) returns NaN.
- ▶ tgamma(  $+ \infty$ ) returns  $+ \infty$ .

# Description

Calculate the gamma function of the input argument  $\times$ , namely the value of  $\int_0^\infty e^{-t}t^{x-1}dt$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# \_\_host\_\_\_\_device\_\_ double trunc (double x)

Truncate input argument to the integral part.

#### Returns

Returns truncated integer value.

### Description

Round x to the nearest integer value that does not exceed x in magnitude.

# \_\_host\_\_\_\_device\_\_ double y0 (double x)

Calculate the value of the Bessel function of the second kind of order 0 for the input argument.

#### **Returns**

Returns the value of the Bessel function of the second kind of order 0.

- ▶ y0(0) returns  $-\infty$ .
- y0(x) returns NaN for x < 0.
- ▶  $y0(+\infty)$  returns +0.

▶ y0(NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the second kind of order 0 for the input argument  $\times$ ,  $Y_0(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double y1 (double x)

Calculate the value of the Bessel function of the second kind of order 1 for the input argument.

#### Returns

Returns the value of the Bessel function of the second kind of order 1.

- ▶ y1(0) returns  $-\infty$ .
- y1(x) returns NaN for x < 0.
- ▶  $y1(+\infty)$  returns +0.
- ▶ y1(NaN) returns NaN.

## Description

Calculate the value of the Bessel function of the second kind of order 1 for the input argument x,  $Y_1(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

\_\_host\_\_\_\_device\_\_ double yn (int n, double x)

Calculate the value of the Bessel function of the second kind of order n for the input argument.

#### Returns

Returns the value of the Bessel function of the second kind of order n.

- yn(n, x) returns NaN for n < 0.
- ▶ yn(n, 0) returns  $-\infty$ .
- yn(n, x) returns NaN for x < 0.
- ▶  $yn(n, +\infty)$  returns +0.

yn(n, NaN) returns NaN.

# Description

Calculate the value of the Bessel function of the second kind of order n for the input argument x,  $Y_n(x)$ .

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.

# 1.4. Single Precision Intrinsics

This section describes single precision intrinsic functions that are only supported in device code.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_cosf (float x)

Calculate the fast approximate cosine of the input argument.

#### Returns

Returns the approximate cosine of x.

# Description

Calculate the fast approximate cosine of the input argument x, measured in radians.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Input and output in the denormal range is flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_exp10f (float x)

Calculate the fast approximate base 10 exponential of the input argument.

#### Returns

Returns an approximation to  $10^x$ .

# **Description**

Calculate the fast approximate base 10 exponential of the input argument x,  $10^x$ .

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Most input and output values around denormal range are flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_expf (float x)

Calculate the fast approximate base *e* exponential of the input argument.

#### Returns

Returns an approximation to  $e^{x}$ .

# Description

Calculate the fast approximate base e exponential of the input argument x,  $e^x$ .

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Most input and output values around denormal range are flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fadd\_rd (float x, float y)

Add two floating point values in round-down mode.

#### Returns

Returns x + y.

### Description

Compute the sum of x and y in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fadd\_rn (float x, float y)

Add two floating point values in round-to-nearest-even mode.

#### Returns

Returns x + y.

## Description

Compute the sum of x and y in round-to-nearest-even rounding mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fadd\_ru (float x, float y)

Add two floating point values in round-up mode.

#### Returns

Returns x + y.

# **Description**

Compute the sum of x and y in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ▶ This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fadd\_rz (float x, float y)

Add two floating point values in round-towards-zero mode.

# Returns

Returns x + y.

Compute the sum of x and y in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ► This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fdiv\_rd (float x, float y)

Divide two floating point values in round-down mode.

#### **Returns**

Returns x / y.

# Description

Divide two floating point values x by y in round-down (to negative infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fdiv\_rn (float x, float y)

Divide two floating point values in round-to-nearest-even mode.

### **Returns**

Returns x / y.

### Description

Divide two floating point values x by y in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fdiv\_ru (float x, float y)

Divide two floating point values in round-up mode.

#### Returns

Returns x / y.

## Description

Divide two floating point values x by y in round-up (to positive infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fdiv\_rz (float x, float y)

Divide two floating point values in round-towards-zero mode.

#### Returns

Returns x / y.

# Description

Divide two floating point values x by y in round-towards-zero mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fdividef (float x, float y)

Calculate the fast approximate division of the input arguments.

## Returns

Returns x / y.

- **\_**fdividef(  $\infty$  , y) returns NaN for  $2^{126} < y < 2^{128}$ .
- fdividef(x, y) returns 0 for  $2^{126} < y < 2^{128}$  and  $x \neq \infty$ .

Calculate the fast approximate division of x by y.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmaf\_rd (float x, float y, float z)

Compute  $x \times y + z$  as a single operation, in round-down mode.

#### **Returns**

Returns the rounded value of  $x \times y + z$  as a single operation.

- fmaf(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- ▶ fmaf(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fmaf(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fmaf(x, y, +∞) returns NaN if  $x \times y$  is an exact  $-\infty$ .

## Description

Computes the value of  $x \times y + z$  as a single ternary operation, rounding the result once in round-down (to negative infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmaf\_rn (float x, float y, float z)

Compute  $x \times y + z$  as a single operation, in round-to-nearest-even mode.

#### Returns

Returns the rounded value of  $x \times y + z$  as a single operation.

- fmaf(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- ▶ fmaf(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fmaf(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fmaf(x, y, +∞) returns NaN if  $x \times y$  is an exact  $-\infty$ .

Computes the value of  $x \times y + z$  as a single ternary operation, rounding the result once in round-to-nearest-even mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmaf\_ru (float x, float y, float z)

Compute  $x \times y + z$  as a single operation, in round-up mode.

#### Returns

Returns the rounded value of  $x \times y + z$  as a single operation.

- fmaf(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- fmaf(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fmaf(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fmaf(x, y, +∞) returns NaN if  $x \times y$  is an exact  $-\infty$ .

# Description

Computes the value of  $x \times y + z$  as a single ternary operation, rounding the result once in round-up (to positive infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmaf\_rz (float x, float y, float z)

Compute  $x \times y + z$  as a single operation, in round-towards-zero mode.

#### Returns

Returns the rounded value of  $x \times y + z$  as a single operation.

- fmaf(  $\pm \infty$ ,  $\pm 0$ , z) returns NaN.
- fmaf(  $\pm 0$ ,  $\pm \infty$ , z) returns NaN.
- ▶ fmaf(x, y,  $-\infty$ ) returns NaN if  $x \times y$  is an exact  $+\infty$ .
- ▶ fmaf(x, y, +∞) returns NaN if  $x \times y$  is an exact -∞.

Computes the value of  $x \times y + z$  as a single ternary operation, rounding the result once in round-towards-zero mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmul\_rd (float x, float y)

Multiply two floating point values in round-down mode.

#### Returns

Returns x \* y.

# Description

Compute the product of x and y in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ▶ This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmul\_rn (float x, float y)

Multiply two floating point values in round-to-nearest-even mode.

### Returns

Returns x \* y.

### Description

Compute the product of x and y in round-to-nearest-even mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ▶ This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmul\_ru (float x, float y)

Multiply two floating point values in round-up mode.

### Returns

Returns x \* y.

## Description

Compute the product of x and y in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fmul\_rz (float x, float y)

Multiply two floating point values in round-towards-zero mode.

# Returns

Returns x \* y.

# Description

Compute the product of x and y in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ▶ This operation will never be merged into a single multiply-add instruction.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_frcp\_rd (float x)

Compute  $\frac{1}{X}$  in round-down mode.

#### Returns

Returns  $\frac{1}{x}$ .

Compute the reciprocal of x in round-down (to negative infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_frcp\_rn (float x)

Compute  $\frac{1}{X}$  in round-to-nearest-even mode.

#### **Returns**

Returns  $\frac{1}{X}$ .

# Description

Compute the reciprocal of  $\boldsymbol{x}$  in round-to-nearest-even mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_frcp\_ru (float x)

Compute  $\frac{1}{X}$  in round-up mode.

### **Returns**

Returns  $\frac{1}{X}$ .

# Description

Compute the reciprocal of x in round-up (to positive infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_frcp\_rz (float x)

Compute  $\frac{1}{X}$  in round-towards-zero mode.

#### Returns

Returns  $\frac{1}{x}$ .

# Description

Compute the reciprocal of x in round-towards-zero mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_frsqrt\_rn (float x)

Compute  $1/\sqrt{x}$  in round-to-nearest-even mode.

#### Returns

Returns  $1/\sqrt{x}$ .

## Description

Compute the reciprocal square root of x in round-to-nearest-even mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsqrt\_rd (float x)

Compute  $\sqrt{x}$  in round-down mode.

### Returns

Returns  $\sqrt{x}$ .

# Description

Compute the square root of x in round-down (to negative infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsqrt\_rn (float x)

Compute  $\sqrt{x}$  in round-to-nearest-even mode.

#### Returns

Returns  $\sqrt{x}$ .

# **Description**

Compute the square root of x in round-to-nearest-even mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsqrt\_ru (float x)

Compute  $\sqrt{x}$  in round-up mode.

#### Returns

Returns  $\sqrt{x}$ .

## Description

Compute the square root of x in round-up (to positive infinity) mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

\_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsqrt\_rz (float x)

Compute  $\sqrt{x}$  in round-towards-zero mode.

#### Returns

Returns  $\sqrt{x}$ .

Compute the square root of x in round-towards-zero mode.

For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsub\_rd (float x, float y)

Subtract two floating point values in round-down mode.

#### Returns

Returns x - y.

# Description

Compute the difference of x and y in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsub\_rn (float x, float y)

Subtract two floating point values in round-to-nearest-even mode.

#### **Returns**

Returns x - y.

### Description

Compute the difference of x and y in round-to-nearest-even rounding mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsub\_ru (float x, float y)

Subtract two floating point values in round-up mode.

#### Returns

Returns x - y.

## Description

Compute the difference of  $\mathbf{x}$  and  $\mathbf{y}$  in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_fsub\_rz (float x, float y)

Subtract two floating point values in round-towards-zero mode.

#### Returns

Returns x - y.

# Description

Compute the difference of x and y in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 6.
- ▶ This operation will never be merged into a single multiply-add instruction.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_log10f (float x)

Calculate the fast approximate base 10 logarithm of the input argument.

### Returns

Returns an approximation to  $\log_{10}(x)$ .

Calculate the fast approximate base 10 logarithm of the input argument x.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Most input and output values around denormal range are flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_log2f (float x)

Calculate the fast approximate base 2 logarithm of the input argument.

#### Returns

Returns an approximation to  $\log_2(x)$ .

# Description

Calculate the fast approximate base 2 logarithm of the input argument x.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Input and output in the denormal range is flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_logf (float x)

Calculate the fast approximate base *e* logarithm of the input argument.

#### Returns

Returns an approximation to  $\log_{a}(x)$ .

### Description

Calculate the fast approximate base e logarithm of the input argument x.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Most input and output values around denormal range are flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_powf (float x, float y)

Calculate the fast approximate of  $x^y$ .

#### Returns

Returns an approximation to  $x^y$ .

## Description

Calculate the fast approximate of x, the first input argument, raised to the power of y, the second input argument,  $x^y$ .

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- Most input and output values around denormal range are flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_saturatef (float x)

Clamp the input argument to [+0.0, 1.0].

#### **Returns**

- ▶ \_saturatef(x) returns 0 if x < 0.
- ▶ \_\_saturatef(x) returns 1 if x > 1.
- ► \_\_saturatef(x) returns x if  $0 \le x \le 1$ .
- \_\_saturatef(NaN) returns 0.

### Description

Clamp the input argument x to be within the interval [+0.0, 1.0].

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ void \_\_sincosf (float x, float \*sptr, float \*cptr)

Calculate the fast approximate of sine and cosine of the first input argument.

#### Returns

none

Calculate the fast approximate of sine and cosine of the first input argument x (measured in radians). The results for sine and cosine are written into the second argument, sptr, and, respectively, third argument, cptr.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- ▶ Denorm input/output is flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_sinf (float x)

Calculate the fast approximate sine of the input argument.

#### Returns

Returns the approximate sine of x.

## Description

Calculate the fast approximate sine of the input argument x, measured in radians.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- ▶ Input and output in the denormal range is flushed to sign preserving 0.0.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_tanf (float x)

Calculate the fast approximate tangent of the input argument.

#### Returns

Returns the approximate tangent of x.

### Description

Calculate the fast approximate tangent of the input argument x, measured in radians.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.2, Table 9.
- The result is computed as the fast divide of \_\_sinf() by \_\_cosf(). Denormal input and output are flushed to sign-preserving 0.0 at each step of the computation.

# 1.5. Double Precision Intrinsics

This section describes double precision intrinsic functions that are only supported in device code.

# \_\_device\_\_ double \_\_ddiv\_rd (double x, double y)

Divide two floating point values in round-down mode.

#### Returns

Returns x / y.

# Description

Divides two floating point values x by y in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_ddiv\_rn (double x, double y)

Divide two floating point values in round-to-nearest-even mode.

#### Returns

Returns x / y.

### Description

Divides two floating point values x by y in round-to-nearest-even mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- Requires compute capability >= 2.0.

# \_device\_\_ double \_\_ddiv\_ru (double x, double y)

Divide two floating point values in round-up mode.

### Returns

Returns x / y.

Divides two floating point values x by y in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ► Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_ddiv\_rz (double x, double y)

Divide two floating point values in round-towards-zero mode.

#### Returns

Returns x / y.

# **Description**

Divides two floating point values x by y in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ► Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_drcp\_rd (double x)

Compute  $\frac{1}{X}$  in round-down mode.

### Returns

Returns  $\frac{1}{X}$ .

### Description

Compute the reciprocal of x in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ► Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_drcp\_rn (double x)

Compute  $\frac{1}{X}$  in round-to-nearest-even mode.

#### Returns

Returns  $\frac{1}{x}$ .

# Description

Compute the reciprocal of x in round-to-nearest-even mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ▶ Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_drcp\_ru (double x)

Compute  $\frac{1}{X}$  in round-up mode.

#### Returns

Returns  $\frac{1}{x}$ .

#### Description

Compute the reciprocal of x in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ▶ Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_drcp\_rz (double x)

Compute  $\frac{1}{X}$  in round-towards-zero mode.

#### **Returns**

Returns  $\frac{1}{x}$ .

## **Description**

Compute the reciprocal of x in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ► Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_dsqrt\_rd (double x)

Compute  $\sqrt{x}$  in round-down mode.

### Returns

Returns  $\sqrt{x}$ .

# Description

Compute the square root of x in round-down (to negative infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_dsqrt\_rn (double x)

Compute  $\sqrt{x}$  in round-to-nearest-even mode.

#### **Returns**

Returns  $\sqrt{x}$ .

### Description

Compute the square root of x in round-to-nearest-even mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ▶ Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_dsqrt\_ru (double x)

Compute  $\sqrt{x}$  in round-up mode.

#### Returns

Returns  $\sqrt{x}$ .

# Description

Compute the square root of x in round-up (to positive infinity) mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ► Requires compute capability >= 2.0.

# \_\_device\_\_ double \_\_dsqrt\_rz (double x)

Compute  $\sqrt{x}$  in round-towards-zero mode.

### **Returns**

Returns  $\sqrt{x}$ .

### Description

Compute the square root of x in round-towards-zero mode.

- For accuracy information for this function see the CUDA C Programming Guide, Appendix D.1, Table 7.
- ▶ Requires compute capability >= 2.0.

# 1.6. Integer Intrinsics

This section describes integer intrinsic functions that are only supported in device code.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_brev (unsigned int x)

Reverse the bit order of a 32 bit unsigned integer.

#### Returns

Returns the bit-reversed value of x. i.e. bit N of the return value corresponds to bit 31-N of x.

# Description

Reverses the bit order of the 32 bit unsigned integer x.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned long long int \_\_brevll (unsigned long long int x)

Reverse the bit order of a 64 bit unsigned integer.

#### Returns

Returns the bit-reversed value of x. i.e. bit N of the return value corresponds to bit 63-N of x.

# Description

Reverses the bit order of the 64 bit unsigned integer x.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_byte\_perm (unsigned int x, unsigned int y, unsigned int s)

Return selected bytes from two 32 bit unsigned integers.

#### **Returns**

The returned value r is computed to be: result[n] := input[selector[n]] where result[n] is the nth byte of r.

#### Description

byte\_perm(x,y,s) returns a 32-bit integer consisting of four bytes from eight input bytes provided in the two input integers x and y, as specified by a selector, s.

The input bytes are indexed as follows: input[0] = x<7:0> input[1] = x<15:8> input[2] = x<23:16> input[3] = x<31:24> input[4] = y<7:0> input[5] = y<15:8> input[6] = y<23:16> input[7] = y<31:24> The selector indices are as follows (the upper 16-bits of the selector

are not used): selector[0] = s<2:0> selector[1] = s<6:4> selector[2] = s<10:8> selector[3] = s<14:12>

Return the number of consecutive high-order zero bits in a 32 bit integer.

#### Returns

Returns a value between 0 and 32 inclusive representing the number of zero bits.

## Description

Count the number of consecutive leading zero bits, starting at the most significant bit (bit 31) of x.

Count the number of consecutive high-order zero bits in a 64 bit integer.

#### **Returns**

Returns a value between 0 and 64 inclusive representing the number of zero bits.

## Description

Count the number of consecutive leading zero bits, starting at the most significant bit (bit 63) of x.

Find the position of the least significant bit set to 1 in a 32 bit integer.

#### Returns

Returns a value between 0 and 32 inclusive representing the position of the first bit set.

\_\_ffs(0) returns 0.

### Description

Find the position of the first (least significant) bit set to 1 in  $\times$ , where the least significant bit position is 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_ffsll (long long int x)

Find the position of the least significant bit set to 1 in a 64 bit integer.

#### **Returns**

Returns a value between 0 and 64 inclusive representing the position of the first bit set.

► \_\_ffsll(0) returns 0.

### Description

Find the position of the first (least significant) bit set to 1 in  $\times$ , where the least significant bit position is 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_hadd (int, int)

Compute average of signed input arguments, avoiding overflow in the intermediate sum.

#### **Returns**

Returns a signed integer value representing the signed average value of the two inputs.

### Description

Compute average of signed input arguments x and y as (x + y) >> 1, avoiding overflow in the intermediate sum.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_mul24 (int x, int y)

Calculate the least significant 32 bits of the product of the least significant 24 bits of two integers.

#### **Returns**

Returns the least significant 32 bits of the product x \* y.

### Description

Calculate the least significant 32 bits of the product of the least significant 24 bits of x and y. The high order 8 bits of x and y are ignored.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ long long int \_\_mul64hi (long long int x, long long int y)

Calculate the most significant 64 bits of the product of the two 64 bit integers.

#### **Returns**

Returns the most significant 64 bits of the product x \* y.

### Description

Calculate the most significant 64 bits of the 128-bit product  $\times$  \* y, where  $\times$  and y are 64-bit integers.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_mulhi (int x, int y)

Calculate the most significant 32 bits of the product of the two 32 bit integers.

#### **Returns**

Returns the most significant 32 bits of the product x \* y.

# Description

Calculate the most significant 32 bits of the 64-bit product x \* y, where x \* y are 32-bit integers.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_popc (unsigned int x)

Count the number of bits that are set to 1 in a 32 bit integer.

#### **Returns**

Returns a value between 0 and 32 inclusive representing the number of set bits.

#### Description

Count the number of bits that are set to 1 in  $\times$ .

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_popcll (unsigned long long int x)

Count the number of bits that are set to 1 in a 64 bit integer.

#### Returns

Returns a value between 0 and 64 inclusive representing the number of set bits.

### Description

Count the number of bits that are set to 1 in x.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_rhadd (int, int)

Compute rounded average of signed input arguments, avoiding overflow in the intermediate sum.

#### **Returns**

Returns a signed integer value representing the signed rounded average value of the two inputs.

### Description

Compute average of signed input arguments x and y as (x + y + 1) >> 1, avoiding overflow in the intermediate sum.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_sad (int x, int y, unsigned int z)

Calculate |x-y|+z, the sum of absolute difference.

#### Returns

Returns |x-y|+z.

#### Description

Calculate |x - y| + z, the 32-bit sum of the third argument z plus and the absolute value of the difference between the first argument, x, and second argument, y.

Inputs x and y are signed 32-bit integers, input z is a 32-bit unsigned integer.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_uhadd (unsigned int, unsigned int)

Compute average of unsigned input arguments, avoiding overflow in the intermediate sum.

### Returns

Returns an unsigned integer value representing the unsigned average value of the two inputs.

### Description

Compute average of unsigned input arguments x and y as (x + y) >> 1, avoiding overflow in the intermediate sum.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_umul24 (unsigned int x, unsigned int y)

Calculate the least significant 32 bits of the product of the least significant 24 bits of two unsigned integers.

#### Returns

Returns the least significant 32 bits of the product x \* y.

### Description

Calculate the least significant 32 bits of the product of the least significant 24 bits of x and y. The high order 8 bits of x and y are ignored.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned long long int \_\_umul64hi (unsigned long long int x, unsigned long long int y)

Calculate the most significant 64 bits of the product of the two 64 unsigned bit integers.

#### Returns

Returns the most significant 64 bits of the product x \* y.

#### Description

Calculate the most significant 64 bits of the 128-bit product x \* y, where x and y are 64-bit unsigned integers.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_umulhi (unsigned int x, unsigned int y)

Calculate the most significant 32 bits of the product of the two 32 bit unsigned integers.

#### **Returns**

Returns the most significant 32 bits of the product x \* y.

### Description

Calculate the most significant 32 bits of the 64-bit product x \* y, where x and y are 32-bit unsigned integers.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_urhadd (unsigned int, unsigned int)

Compute rounded average of unsigned input arguments, avoiding overflow in the intermediate sum.

#### Returns

Returns an unsigned integer value representing the unsigned rounded average value of the two inputs.

### Description

Compute average of unsigned input arguments x and y as (x + y + 1) >> 1, avoiding overflow in the intermediate sum.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_usad (unsigned int x, unsigned int y, unsigned int z)

Calculate |x-y|+z, the sum of absolute difference.

#### **Returns**

Returns |x-y|+z.

### Description

Calculate |x - y| + z, the 32-bit sum of the third argument z plus and the absolute value of the difference between the first argument, x, and second argument, y.

Inputs x, y, and z are unsigned 32-bit integers.

# 1.7. Type Casting Intrinsics

This section describes type casting intrinsic functions that are only supported in device code.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_double2int\_rz (double)

Convert a double to a signed int in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the double-precision floating point value x to a signed integer value in round-towards-zero mode.

Convert a double to a signed 64-bit int in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the double-precision floating point value x to a signed 64-bit integer value in round-towards-zero mode.

Convert a double to an unsigned int in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the double-precision floating point value x to an unsigned integer value in round-towards-zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned long long int \_\_double2ull\_rz (double)

Convert a double to an unsigned 64-bit int in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the double-precision floating point value x to an unsigned 64-bit integer value in round-towards-zero mode.

Convert a single-precision float to a half-precision float in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision float value x to a half-precision floating point value represented in unsigned short format, in round-to-nearest-even mode.

Convert a float to a signed integer in round-down mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value x to a signed integer in round-down (to negative infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_float2int\_rn (float x)

Convert a float to a signed integer in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to a signed integer in round-to-nearest-even mode.

Convert a float to a signed integer in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value x to a signed integer in round-up (to positive infinity) mode.

Convert a float to a signed integer in round-towards-zero mode.

#### Returns

Returns converted value.

#### **Description**

Convert the single-precision floating point value x to a signed integer in round-towards-zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ long long int \_\_float2ll\_rd (float x)

Convert a float to a signed 64-bit integer in round-down mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to a signed 64-bit integer in round-down (to negative infinity) mode.

Convert a float to a signed 64-bit integer in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value x to a signed 64-bit integer in round-to-nearest-even mode.

Convert a float to a signed 64-bit integer in round-up mode.

#### Returns

Returns converted value.

# Description

Convert the single-precision floating point value x to a signed 64-bit integer in round-up (to positive infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ long long int \_\_float2ll\_rz (float x)

Convert a float to a signed 64-bit integer in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to a signed 64-bit integer in round-towards-zero mode.

Convert a float to an unsigned integer in round-down mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to an unsigned integer in round-down (to negative infinity) mode.

Convert a float to an unsigned integer in round-to-nearest-even mode.

#### Returns

Returns converted value.

# Description

Convert the single-precision floating point value  $\times$  to an unsigned integer in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_float2uint\_ru (float x)

Convert a float to an unsigned integer in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to an unsigned integer in round-up (to positive infinity) mode.

Convert a float to an unsigned integer in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value  $\times$  to an unsigned integer in round-towards-zero mode.

Convert a float to an unsigned 64-bit integer in round-down mode.

#### Returns

Returns converted value.

# Description

Convert the single-precision floating point value x to an unsigned 64-bit integer in round-down (to negative infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned long long int \_\_float2ull\_rn (float x)

Convert a float to an unsigned 64-bit integer in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value x to an unsigned 64-bit integer in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned long long int \_\_float2ull\_ru (float x)

Convert a float to an unsigned 64-bit integer in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the single-precision floating point value x to an unsigned 64-bit integer in round-up (to positive infinity) mode.

Convert a float to an unsigned 64-bit integer in round-towards-zero mode.

#### Returns

Returns converted value.

# Description

Convert the single-precision floating point value x to an unsigned 64-bit integer in round-towards\_zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ int \_\_float\_as\_int (float x)

Reinterpret bits in a float as a signed integer.

#### Returns

Returns reinterpreted value.

### Description

Reinterpret the bits in the single-precision floating point value x as a signed integer.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_half2float (unsigned short x)

Convert a half-precision float to a single-precision float in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the half-precision floating point value x represented in unsigned short format to a single-precision floating point value.

Convert a signed integer to a float in round-down mode.

#### Returns

Returns converted value.

#### Description

Convert the signed integer value x to a single-precision floating point value in round-down (to negative infinity) mode.

Convert a signed integer to a float in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the signed integer value  $\times$  to a single-precision floating point value in round-to-nearest-even mode.

Convert a signed integer to a float in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the signed integer value x to a single-precision floating point value in round-up (to positive infinity) mode.

Convert a signed integer to a float in round-towards-zero mode.

#### Returns

Returns converted value.

# Description

Convert the signed integer value  $\times$  to a single-precision floating point value in round-towards-zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_int\_as\_float (int x)

Reinterpret bits in an integer as a float.

#### Returns

Returns reinterpreted value.

### Description

Reinterpret the bits in the signed integer value  $\times$  as a single-precision floating point value.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ll2float\_rd (long long int x)

Convert a signed integer to a float in round-down mode.

#### Returns

Returns converted value.

### Description

Convert the signed integer value x to a single-precision floating point value in round-down (to negative infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ll2float\_rn (long long int x)

Convert a signed 64-bit integer to a float in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the signed 64-bit integer value x to a single-precision floating point value in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ll2float\_ru (long long int x)

Convert a signed integer to a float in round-up mode.

#### **Returns**

Returns converted value.

### Description

Convert the signed integer value  $\times$  to a single-precision floating point value in round-up (to positive infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ll2float\_rz (long long int x)

Convert a signed integer to a float in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the signed integer value  $\times$  to a single-precision floating point value in round-towards-zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_uint2float\_rd (unsigned int x)

Convert an unsigned integer to a float in round-down mode.

#### Returns

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-down (to negative infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_uint2float\_rn (unsigned int x)

Convert an unsigned integer to a float in round-to-nearest-even mode.

#### **Returns**

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_uint2float\_ru (unsigned int x)

Convert an unsigned integer to a float in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-up (to positive infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_uint2float\_rz (unsigned int x)

Convert an unsigned integer to a float in round-towards-zero mode.

#### Returns

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-towards-zero mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ull2float\_rd (unsigned long long int x)

Convert an unsigned integer to a float in round-down mode.

#### **Returns**

Returns converted value.

### Description

Convert the unsigned integer value  $\times$  to a single-precision floating point value in round-down (to negative infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ull2float\_rn (unsigned long long int x)

Convert an unsigned integer to a float in round-to-nearest-even mode.

#### Returns

Returns converted value.

### Description

Convert the unsigned integer value  $\times$  to a single-precision floating point value in round-to-nearest-even mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ull2float\_ru (unsigned long long int x)

Convert an unsigned integer to a float in round-up mode.

#### Returns

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-up (to positive infinity) mode.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ float \_\_ull2float\_rz (unsigned long long int x)

Convert an unsigned integer to a float in round-towards-zero mode.

#### **Returns**

Returns converted value.

### Description

Convert the unsigned integer value x to a single-precision floating point value in round-towards-zero mode.

# 1.8. SIMD Intrinsics

This section describes SIMD intrinsic functions that are only supported in device code.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabs2 (unsigned int a)

Computes per-halfword absolute value.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 2 parts, each consisting of 2 bytes, then computes absolute value for each of parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabs4 (unsigned int a)

Computes per-byte absolute value.

#### Returns

Returns computed value.

### Description

Splits argument by bytes. Computes absolute value of each byte. Result is stored as unsigned int.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsdiffs2 (unsigned int a, unsigned int b)

Computes per-halfword sum of absolute difference of signed integer.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each into 2 parts, each consisting of 2 bytes. For corresponding parts function computes absolute difference. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsdiffs4 (unsigned int a, unsigned int b)

Computes per-byte absolute difference of signed integer.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each into 4 parts, each consisting of 1 byte. For corresponding parts function computes absolute difference. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsdiffu2 (unsigned int a, unsigned int b)

Performs per-halfword absolute difference of unsigned integer computation: |a - b|.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes absolute difference. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsdiffu4 (unsigned int a, unsigned int b)

Computes per-byte absolute difference of unsigned integer.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes absolute difference. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsss2 (unsigned int a)

Computes per-halfword absolute value with signed saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 2 parts, each consisting of 2 bytes, then computes absolute value with signed saturation for each of parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vabsss4 (unsigned int a)

Computes per-byte absolute value with signed saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 4 parts, each consisting of 1 byte, then computes absolute value with signed saturation for each of parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vadd2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed addition, with wrap-around: a + b.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes, then performs unsigned addition on corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vadd4 (unsigned int a, unsigned int b)

Performs per-byte (un)signed addition.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte, then performs unsigned addition on corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vaddss2 (unsigned int a, unsigned int b)

Performs per-halfword addition with signed saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes, then performs addition with signed saturation on corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vaddss4 (unsigned int a, unsigned int b)

Performs per-byte addition with signed saturation.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte, then performs addition with signed saturation on corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vaddus2 (unsigned int a, unsigned int b)

Performs per-halfword addition with unsigned saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes, then performs addition with unsigned saturation on corresponding parts.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vaddus4 (unsigned int a, unsigned int b)

Performs per-byte addition with unsigned saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte, then performs addition with unsigned saturation on corresponding parts.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vavgs2 (unsigned int a, unsigned int b)

Performs per-halfword signed rounded average computation.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. then computes signed rounded avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vavgs4 (unsigned int a, unsigned int b)

Computes per-byte signed rounder average.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. then computes signed rounded avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vavgu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned rounded average computation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. then computes unsigned rounded avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vavgu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned rounded average.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. then computes unsigned rounded avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpeq2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed comparison.

#### Returns

Returns 0xffff computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if they are equal, and 0000 otherwise. For example \_\_vcmpeq2(0x1234aba5, 0x1234aba6) returns 0xffff0000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpeq4 (unsigned int a, unsigned int b)

Performs per-byte (un)signed comparison.

#### Returns

Returns 0xff if a = b, else returns 0.

#### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if they are equal, and 00 otherwise. For example \_\_vcmpeq4(0x1234aba5, 0x1234aba6) returns 0xffffff00.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpges2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison:  $a \ge b$ ? 0xffff : 0.

#### **Returns**

Returns 0xffff if  $a \ge b$ , else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part >= 'b' part, and 0000 otherwise. For example \_\_vcmpges2(0x1234aba5, 0x1234aba6) returns 0xffff0000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpges4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### Returns

Returns 0xff if  $a \ge b$ , else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part >= 'b' part, and 00 otherwise. For example \_\_vcmpges4(0x1234aba5, 0x1234aba6) returns 0xffffff00.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgeu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison:  $a \ge b$ ? 0xffff : 0.

#### Returns

Returns 0xffff if  $a \ge b$ , else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part >= 'b' part, and 0000 otherwise. For example \_\_vcmpgeu2(0x1234aba5, 0x1234aba6) returns 0xffff0000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgeu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### **Returns**

Returns 0xff if a = b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part >= 'b' part, and 00 otherwise. For example \_\_vcmpgeu4(0x1234aba5, 0x1234aba6) returns 0xffffff00.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgts2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison: a > b ? 0xffff : 0.

#### Returns

Returns 0xffff if a > b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part > 'b' part, and 0000 otherwise. For example \_\_vcmpgts2(0x1234aba5, 0x1234aba6) returns 0x00000000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgts4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### Returns

Returns 0xff if a > b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part > 'b' part, and 00 otherwise. For example \_\_vcmpgts4(0x1234aba5, 0x1234aba6) returns 0x00000000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgtu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison: a > b ? 0xffff : 0.

#### **Returns**

Returns 0xffff if a > b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part > 'b' part, and 0000 otherwise. For example \_\_vcmpgtu2(0x1234aba5, 0x1234aba6) returns 0x00000000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpgtu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### Returns

Returns 0xff if a > b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part > 'b' part, and 00 otherwise. For example \_\_vcmpgtu4(0x1234aba5, 0x1234aba6) returns 0x00000000.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmples2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison: a <= b ? 0xffff : 0.

#### Returns

Returns 0xffff if a  $\leq$  b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part <= 'b' part, and 0000 otherwise. For example \_\_vcmples2(0x1234aba5, 0x1234aba6) returns 0xffffffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmples4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### **Returns**

Returns 0xff if a  $\leq$  b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part <= 'b' part, and 00 otherwise. For example \_\_vcmples4(0x1234aba5, 0x1234aba6) returns 0xffffffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpleu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison:  $a \le b$ ? 0xffff : 0.

#### Returns

Returns 0xffff if a <= b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part <= 'b' part, and 0000 otherwise. For example \_\_vcmpleu2(0x1234aba5, 0x1234aba6) returns 0xffffffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpleu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### Returns

Returns 0xff if a  $\leq$  b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part <= 'b' part, and 00 otherwise. For example \_\_vcmpleu4(0x1234aba5, 0x1234aba6) returns 0xffffffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmplts2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison: a < b ? 0xffff : 0.

#### **Returns**

Returns 0xffff if a < b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part < 'b' part, and 0000 otherwise. For example \_\_vcmplts2(0x1234aba5, 0x1234aba6) returns 0x0000ffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmplts4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### Returns

Returns 0xff if a < b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part < 'b' part, and 00 otherwise. For example \_\_vcmplts4(0x1234aba5, 0x1234aba6) returns 0x0000000ff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpltu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison: a < b ? 0xffff : 0.

#### Returns

Returns 0xffff if a < b, else returns 0.

#### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part < 'b' part, and 0000 otherwise. For example \_\_vcmpltu2(0x1234aba5, 0x1234aba6) returns 0x0000ffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpltu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### **Returns**

Returns 0xff if a < b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part < 'b' part, and 00 otherwise. For example \_\_vcmpltu4(0x1234aba5, 0x1234aba6) returns 0x000000ff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpne2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed comparison: a != b ? 0xffff : 0.

#### Returns

Returns 0xffff if a != b, else returns 0.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts result is ffff if 'a' part != 'b' part, and 0000 otherwise. For example \_\_vcmplts2(0x1234aba5, 0x1234aba6) returns 0x0000ffff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vcmpne4 (unsigned int a, unsigned int b)

Performs per-byte (un)signed comparison.

#### Returns

Returns 0xff if a != b, else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts result is ff if 'a' part != 'b' part, and 00 otherwise. For example \_\_vcmplts4(0x1234aba5, 0x1234aba6) returns 0x000000ff.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vhaddu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned average computation.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. then computes unsigned avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vhaddu4 (unsigned int a, unsigned int b)

Computes per-byte unsigned average.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. then computes unsigned avarege of corresponding parts. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmaxs2 (unsigned int a, unsigned int b)

Performs per-halfword signed maximum computation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes signed maximum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmaxs4 (unsigned int a, unsigned int b)

Computes per-byte signed maximum.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes signed maximum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmaxu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned maximum computation.

#### Returns

Returns computed value.

#### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes unsigned maximum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmaxu4 (unsigned int a, unsigned int b)

Computes per-byte unsigned maximum.

#### Returns

Returns computed value.

#### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes unsigned maximum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmins2 (unsigned int a, unsigned int b)

Performs per-halfword signed minimum computation.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes signed minimum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vmins4 (unsigned int a, unsigned int b)

Computes per-byte signed minimum.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes signed minimum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vminu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned minimum computation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes unsigned minimum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vminu4 (unsigned int a, unsigned int b)

Computes per-byte unsigned minimum.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes unsigned minimum. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vneg2 (unsigned int a)

Computes per-halfword negation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 2 parts, each consisting of 2 bytes. For each part function computes negation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vneg4 (unsigned int a)

Performs per-byte negation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 4 parts, each consisting of 1 byte. For each part function computes negation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vnegss2 (unsigned int a)

Computes per-halfword negation with signed saturation.

#### **Returns**

Returns computed value.

### Description

Splits 4 bytes of argument into 2 parts, each consisting of 2 bytes. For each part function computes negation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vnegss4 (unsigned int a)

Performs per-byte negation with signed saturation.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of argument into 4 parts, each consisting of 1 byte. For each part function computes negation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsads2 (unsigned int a, unsigned int b)

Performs per-halfword sum of absolute difference of signed.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts functions computes absolute difference and sum it up. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsads4 (unsigned int a, unsigned int b)

Computes per-byte sum of abs difference of signed.

#### **Returns**

Returns computed value.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts functions computes absolute difference and sum it up. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsadu2 (unsigned int a, unsigned int b)

Computes per-halfword sum of abs diff of unsigned.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function computes absolute differences, and returns sum of those differences.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsadu4 (unsigned int a, unsigned int b)

Computes per-byte sum af abs difference of unsigned.

#### Returns

Returns computed value.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function computes absolute differences, and returns sum of those differences.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vseteq2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed comparison.

#### **Returns**

Returns 1 if a = b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part == 'b' part. If both equalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vseteq4 (unsigned int a, unsigned int b)

Performs per-byte (un)signed comparison.

## **Returns**

Returns 1 if a = b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part == 'b' part. If both equalities are satisfiad, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetges2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison.

#### Returns

Returns 1 if  $a \ge b$ , else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part >= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetges4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### **Returns**

Returns 1 if  $a \ge b$ , else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part >= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgeu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned minimum unsigned comparison.

#### Returns

Returns 1 if  $a \ge b$ , else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part >= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgeu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### Returns

Returns 1 if  $a \ge b$ , else returns 0.

### Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part >= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgts2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison.

#### **Returns**

Returns 1 if a > b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part > 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgts4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

## Returns

Returns 1 if a > b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part > 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgtu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison.

#### Returns

Returns 1 if a > b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part > 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetgtu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### **Returns**

Returns 1 if a > b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part > 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetles2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned minimum computation.

## **Returns**

Returns 1 if a <= b, else returns 0.

## Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetles4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### Returns

Returns 1 if a <= b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetleu2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison.

#### **Returns**

Returns 1 if a  $\leq$  b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetleu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### Returns

Returns 1 if a  $\leq$  b, else returns 0.

## Description

Splits 4 bytes of each argument into 4 part, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetlts2 (unsigned int a, unsigned int b)

Performs per-halfword signed comparison.

#### Returns

Returns 1 if a < b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetlts4 (unsigned int a, unsigned int b)

Performs per-byte signed comparison.

#### **Returns**

Returns 1 if a < b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetltu2 (unsigned int a, unsigned int b)

Performs per-halfword unsigned comparison.

## **Returns**

Returns 1 if a < b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetltu4 (unsigned int a, unsigned int b)

Performs per-byte unsigned comparison.

#### Returns

Returns 1 if a < b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part <= 'b' part. If both inequalities are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetne2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed comparison.

#### **Returns**

Returns 1 if a != b, else returns 0.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts function performs comparison 'a' part != 'b' part. If both conditions are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsetne4 (unsigned int a, unsigned int b)

Performs per-byte (un)signed comparison.

#### Returns

Returns 1 if a != b, else returns 0.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts function performs comparison 'a' part != 'b' part. If both conditions are satisfied, function returns 1.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsub2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed substraction, with wrap-around.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts functions performs substraction. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsub4 (unsigned int a, unsigned int b)

Performs per-byte substraction.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts functions performs substraction. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsubss2 (unsigned int a, unsigned int b)

Performs per-halfword (un)signed substraction, with signed saturation.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts functions performs substraction with signed saturation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsubss4 (unsigned int a, unsigned int b)

Performs per-byte substraction with signed saturation.

#### Returns

Returns computed value.

## Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts functions performs substraction with signed saturation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsubus2 (unsigned int a, unsigned int b)

Performs per-halfword substraction with unsigned saturation.

#### Returns

Returns computed value.

# Description

Splits 4 bytes of each argument into 2 parts, each consisting of 2 bytes. For corresponding parts functions performs substraction with unsigned saturation. Result is stored as unsigned int and returned.

# \_\_DEVICE\_FUNCTIONS\_DECL\_\_ unsigned int \_\_vsubus4 (unsigned int a, unsigned int b)

Performs per-byte substraction with unsigned saturation.

## Returns

Returns computed value.

## Description

Splits 4 bytes of each argument into 4 parts, each consisting of 1 byte. For corresponding parts functions performs substraction with unsigned saturation. Result is stored as unsigned int and returned.

# 1.9. Half Precision Intrinsics

This section describes half precision intrinsic functions that are only supported in device code.

Half Arithmetic Functions

Half2 Arithmetic Functions

Half Comparison Functions

Half2 Comparison Functions

# Half Precision Conversion And Data Movement

# 1.9.1. Half Arithmetic Functions

Half Precision Intrinsics

\_\_CUDA\_FP16\_DECL\_\_ \_half \_\_hadd (const \_\_half a, const \_\_half b)

Performs half addition in round-to-nearest mode.

#### Returns

Returns the half result of adding a and b.

# Description

Performs half addition of inputs a and b, in round-to-nearest mode.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half \_\_hadd\_sat (const \_\_half a, const \_\_half b)

Performs half addition in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half result of adding a and b with saturation.

## Description

Performs half add of inputs a and b, in round-to-nearest mode, and clamps the result to range [0.0, 1.0]. NaN results are flushed to +0.0.

\_\_CUDA\_FP16\_DECL\_\_ \_half \_\_hfma (const \_\_half a, const \_\_half b, const \_\_half c)

Performs half fused multiply-add in round-to-nearest mode.

#### Returns

Returns the half result of the fused multiply-add operation on a, b, and c.

## Description

Performs half multiply on inputs a and b, then performs a half add of the result with c, rounding the result once in round-to-nearest mode.

CUDA_FP16_DECL	$\_$ half $\_$	hfma_sat (const _	_half a, const
half b, consthalf c		·	

Performs half fused multiply-add in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half result of the fused multiply-add operation on a, b, and c with saturation.

# Description

Performs half multiply on inputs a and b, then performs a half add of the result with c, rounding the result once in round-to-nearest mode, and clamps the result to range [0.0, 1.0]. NaN results are flushed to +0.0.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half \_\_hmul (const \_\_half a, const \_\_half b)

Performs half multiplication in round-to-nearest mode.

#### Returns

Returns the half result of multiplying a and b.

## Description

Performs half multiplication of inputs a and b, in round-to-nearest mode.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half \_\_hmul\_sat (const \_\_half a, const \_\_half b)

Performs half multiplication in round-to-nearest mode, with saturation to [0.0, 1.0].

### Returns

Returns the half result of multiplying a and b with saturation.

## Description

Performs half multiplication of inputs a and b, in round-to-nearest mode, and clamps the result to range [0.0, 1.0]. NaN results are flushed to +0.0.

CUDA_FP16_DECLhalfhneg (consthalf a) Negates input half number and returns the result.
rvegates input hall number and returns the result.
Returns
Returns negated half input a.
Description
Negates input half number and returns the result.
CUDA_FP16_DECLhalfhsub (consthalf a, consthalf b)
Performs half subtraction in round-to-nearest mode.
Returns
Returns the half result of subtraction b from a.
Description
Subtracts half input b from input a in round-to-nearest mode.
CUDA_FP16_DECLhalfhsub_sat (consthalf a, const

## **Returns**

half b)

Returns the half result of subtraction b from a with saturation.

# Description

Subtracts half input b from input a in round-to-nearest mode, and clamps the result to range [0.0, 1.0]. NaN results are flushed to +0.0.

Performs half subtraction in round-to-nearest mode, with saturation to [0.0, 1.0].

# 1.9.2. Half2 Arithmetic Functions

Half Precision Intrinsics

Performs half2 vector addition in round-to-nearest mode.

#### **Returns**

Returns the half2 vector result of adding vectors a and b.

# Description

Performs half2 vector add of inputs a and b, in round-to-nearest mode.

Performs half2 vector addition in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half2 vector result of adding vectors a and b with saturation.

# Description

Performs half2 vector add of inputs a and b, in round-to-nearest mode, and clamps the results to range [0.0, 1.0]. NaN results are flushed to +0.0.

Performs half2 vector fused multiply-add in round-to-nearest mode.

#### Returns

Returns the half2 vector result of the fused multiply-add operation on vectors a, b, and c.

## Description

Performs half2 vector multiply on inputs a and b, then performs a half2 vector add of the result with c, rounding the result once in round-to-nearest mode.

CUDA_FP16_DECL	_half2	_hfma2_sat (const _	_half2 a, const
half2 b, consthalf2	( c)	,	

Performs half2 vector fused multiply-add in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half2 vector result of the fused multiply-add operation on vectors a, b, and c with saturation.

# **Description**

Performs half2 vector multiply on inputs a and b, then performs a half2 vector add of the result with c, rounding the result once in round-to-nearest mode, and clamps the results to range [0.0, 1.0]. NaN results are flushed to +0.0.

Performs half2 vector multiplication in round-to-nearest mode.

#### Returns

Returns the half2 vector result of multiplying vectors a and b.

## Description

Performs half2 vector multiplication of inputs a and b, in round-to-nearest mode.

CUDA_FP16_DECL	half2 _	hmul2_	sat (const )	half2 a,	const
half2 b)			,		

Performs half2 vector multiplication in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half2 vector result of multiplying vectors a and b with saturation.

## Description

Performs half2 vector multiplication of inputs a and b, in round-to-nearest mode, and clamps the results to range [0.0, 1.0]. NaN results are flushed to +0.0.

CUDA FP16 DECL	half2	hneg2	(const	half2 a)
			`	

Negates both halves of the input half2 number and returns the result.

#### Returns

Returns half2 number with both halves negated.

# Description

Negates both halves of the input half2 number a and returns the result.

Performs half2 vector subtraction in round-to-nearest mode.

#### Returns

Returns the half2 vector result of subtraction vector b from a.

# Description

Subtracts half2 input vector b from input vector a in round-to-nearest mode.

```
__CUDA_FP16_DECL__ _half2 __hsub2_sat (const __half2 a, const __half2 b)
```

Performs half2 vector subtraction in round-to-nearest mode, with saturation to [0.0, 1.0].

#### Returns

Returns the half2 vector result of subtraction vector b from a with saturation.

## Description

Subtracts half2 input vector b from input vector a in round-to-nearest mode, and clamps the results to range [0.0, 1.0]. NaN results are flushed to +0.0.

# 1.9.3. Half Comparison Functions

Half Precision Intrinsics

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_heq (const \_\_half a, const \_\_half b) Performs half if-equal comparison.

### Returns

Returns boolean result of if-equal comparison of a and b.

# Description

Performs half if-equal comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hequ (const \_\_half a, const \_\_half b) Performs half unordered if-equal comparison.

#### Returns

Returns boolean result of unordered if-equal comparison of a and b.

# Description

Performs half if-equal comparison of inputs a and b. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hge (const \_\_half a, const \_\_half b) Performs half greater-equal comparison.

#### Returns

Returns boolean result of greater-equal comparison of a and b.

#### Description

Performs half greater-equal comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hgeu (const \_\_half a, const \_\_half b)
Performs half unordered greater-equal comparison.

#### Returns

Returns boolean result of unordered greater-equal comparison of a and b.

## Description

Performs half greater-equal comparison of inputs a and b. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hgt (const \_\_half a, const \_\_half b) Performs half greater-than comparison.

#### **Returns**

Returns boolean result of greater-than comparison of a and b.

# Description

Performs half greater-than comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hgtu (const \_\_half a, const \_\_half b)
Performs half unordered greater-than comparison.

#### Returns

Returns boolean result of unordered greater-than comparison of a and b.

# Description

Performs half greater-than comparison of inputs a and b. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ int \_\_hisinf (const \_\_half a)

Checks if the input half number is infinite.

#### **Returns**

Returns -1 iff a is equal to negative infinity, 1 iff a is equal to positive infinity and 0 otherwise.

### Description

Checks if the input half number a is infinite.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hisnan (const \_\_half a)

Determine whether half argument is a NaN.

#### Returns

Returns boolean true iff argument is a NaN, boolean false otherwise.

## Description

Determine whether half value a is a NaN.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hle (const \_\_half a, const \_\_half b) Performs half less-equal comparison.

#### Returns

Returns boolean result of less-equal comparison of a and b.

# Description

Performs half less-equal comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hleu (const \_\_half a, const \_\_half b) Performs half unordered less-equal comparison.

#### Returns

Returns boolean result of unordered less-equal comparison of a and b.

# Description

Performs half less-equal comparison of inputs a and b. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hlt (const \_\_half a, const \_\_half b) Performs half less-than comparison.

#### Returns

Returns boolean result of less-than comparison of a and b.

# Description

Performs half less-than comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hltu (const \_\_half a, const \_\_half b) Performs half unordered less-than comparison.

#### Returns

Returns boolean result of unordered less-than comparison of a and b.

Performs half less-than comparison of inputs a and b. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hne (const \_\_half a, const \_\_half b) Performs half not-equal comparison.

#### Returns

Returns boolean result of not-equal comparison of a and b.

# Description

Performs half not-equal comparison of inputs a and b. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hneu (const \_\_half a, const \_\_half b)
Performs half unordered not-equal comparison.

#### Returns

Returns boolean result of unordered not-equal comparison of a and b.

# Description

Performs half not-equal comparison of inputs a and b. NaN inputs generate true results.

# 1.9.4. Half2 Comparison Functions

Half Precision Intrinsics

\_\_CUDA\_FP16\_DECL\_\_ bool \_\_hbeq2 (const \_\_half2 a, const \_\_half2 b)

Performs half2 vector if-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of if-equal comparison of vectors a and b are true, boolean false otherwise.

Performs half2 vector if-equal comparison of inputs a and b. The bool result is set to true only if both half if-equal comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered if-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### **Returns**

Returns boolean true if both half results of unordered if-equal comparison of vectors a and b are true, boolean false otherwise.

# Description

Performs half2 vector if-equal comparison of inputs a and b. The bool result is set to true only if both half if-equal comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector greater-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of greater-equal comparison of vectors a and b are true, boolean false otherwise.

## Description

Performs half2 vector greater-equal comparison of inputs a and b. The bool result is set to true only if both half greater-equal comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered greater-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of unordered greater-equal comparison of vectors a and b are true, boolean false otherwise.

# **Description**

Performs half2 vector greater-equal comparison of inputs a and b. The bool result is set to true only if both half greater-equal comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector greater-than comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of greater-than comparison of vectors a and b are true, boolean false otherwise.

#### Description

Performs half2 vector greater-than comparison of inputs a and b. The bool result is set to true only if both half greater-than comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered greater-than comparison, and returns boolean true iff both half results are true, boolean false otherwise.

## Returns

Returns boolean true if both half results of unordered greater-than comparison of vectors a and b are true, boolean false otherwise.

Performs half2 vector greater-than comparison of inputs a and b. The bool result is set to true only if both half greater-than comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector less-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of less-equal comparison of vectors a and b are true, boolean false otherwise.

# Description

Performs half2 vector less-equal comparison of inputs a and b. The bool result is set to true only if both half less-equal comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered less-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of unordered less-equal comparison of vectors a and b are true, boolean false otherwise.

## Description

Performs half2 vector less-equal comparison of inputs a and b. The bool result is set to true only if both half less-equal comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector less-than comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of less-than comparison of vectors a and b are true, boolean false otherwise.

# **Description**

Performs half2 vector less-than comparison of inputs a and b. The bool result is set to true only if both half less-than comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered less-than comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of unordered less-than comparison of vectors a and b are true, boolean false otherwise.

#### Description

Performs half2 vector less-than comparison of inputs a and b. The bool result is set to true only if both half less-than comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector not-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

## **Returns**

Returns boolean true if both half results of not-equal comparison of vectors a and b are true, boolean false otherwise.

Performs half2 vector not-equal comparison of inputs a and b. The bool result is set to true only if both half not-equal comparisons evaluate to true, or false otherwise. NaN inputs generate false results.

Performs half2 vector unordered not-equal comparison, and returns boolean true iff both half results are true, boolean false otherwise.

#### Returns

Returns boolean true if both half results of unordered not-equal comparison of vectors a and b are true, boolean false otherwise.

# Description

Performs half2 vector not-equal comparison of inputs a and b. The bool result is set to true only if both half not-equal comparisons evaluate to true, or false otherwise. NaN inputs generate true results.

Performs half2 vector if-equal comparison.

# Returns

Returns the half2 vector result of if-equal comparison of vectors a and b.

# Description

Performs half2 vector if-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

Performs half2 vector unordered if-equal comparison.

#### Returns

Returns the half2 vector result of unordered if-equal comparison of vectors a and b.

Performs half2 vector if-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

Performs half2 vector greater-equal comparison.

#### Returns

Returns the half2 vector result of greater-equal comparison of vectors a and b.

# Description

Performs half2 vector greater-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

Performs half2 vector unordered greater-equal comparison.

#### Returns

Returns the half2 vector result of unordered greater-equal comparison of vectors a and b.

#### Description

Performs half2 vector greater-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

Performs half2 vector greater-than comparison.

#### **Returns**

Returns the half2 vector result of greater-than comparison of vectors a and b.

#### Description

Performs half2 vector greater-than comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

Performs half2 vector unordered greater-than comparison.

#### Returns

Returns the half2 vector result of unordered greater-than comparison of vectors a and b.

# Description

Performs half2 vector greater-than comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ \_half2 \_\_hisnan2 (const \_\_half2 a) Determine whether half2 argument is a NaN.

#### **Returns**

Returns half2 which has the corresponding half results set to 1.0 for true, or 0.0 for false.

# **Description**

Determine whether each half of input half2 number a is a NaN.

Performs half2 vector less-equal comparison.

#### Returns

Returns the half2 vector result of less-equal comparison of vectors a and b.

#### Description

Performs half2 vector less-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

Performs half2 vector unordered less-equal comparison.

#### Returns

Returns the half2 vector result of unordered less-equal comparison of vectors a and b.

# Description

Performs half2 vector less-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_hlt2 (const \_\_half2 a, const \_\_half2 b)

Performs half2 vector less-than comparison.

#### Returns

Returns the half2 vector result of less-than comparison of vectors a and b.

# Description

Performs half2 vector less-than comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_hltu2 (const \_\_half2 a, const half2 b)

Performs half2 vector unordered less-than comparison.

#### Returns

Returns the half2 vector result of unordered less-than comparison of vectors a and b.

## Description

Performs half2 vector less-than comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

Performs half2 vector not-equal comparison.

#### Returns

Returns the half2 vector result of not-equal comparison of vectors a and b.

# Description

Performs half2 vector not-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate false results.

Performs half2 vector unordered not-equal comparison.

#### Returns

Returns the half2 vector result of unordered not-equal comparison of vectors a and b.

# Description

Performs half2 vector not-equal comparison of inputs a and b. The corresponding half results are set to 1.0 for true, or 0.0 for false. NaN inputs generate true results.

# 1.9.5. Half Precision Conversion And Data Movement

Half Precision Intrinsics

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_float22half2\_rn (const float2 a)

Converts both components of float2 number to half precision in round-to-nearest mode and returns half2 with converted values.

#### Returns

Returns half2 which has corresponding halves equal to the converted float2 components.

# Description

Converts both components of float2 to half precision in round-to-nearest mode and combines the results into one half2 number. Low 16 bits of the return value correspond to a.x and high 16 bits of the return value correspond to a.y.

# \_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_float2half2\_rn (const float a)

Converts input to half precision in round-to-nearest mode and populates both halves of half2 with converted value.

#### Returns

Returns half2 with both halves equal to the converted half precision number.

# Description

Converts input a to half precision in round-to-nearest mode and populates both halves of half2 with converted value.

# \_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_floats2half2\_rn (const float a, const float b)

Converts both input floats to half precision in round-to-nearest mode and returns half2 with converted values.

#### Returns

Returns half2 which has corresponding halves equal to the converted input floats.

# Description

Converts both input floats to half precision in round-to-nearest mode and combines the results into one half2 number. Low 16 bits of the return value correspond to the input a, high 16 bits correspond to the input b.

Converts both halves of half2 to float2 and returns the result.

#### Returns

Returns converted float2.

#### Description

Converts both halves of half2 input a to float2 and returns the result.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_half2half2 (const \_\_half a)

Returns half2 with both halves equal to the input value.

#### Returns

Returns half2 with both halves equal to the input a.

Returns half2 number with both halves equal to the input a half number.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_halves2half2 (const \_\_half a, const \_\_half b)

Combines two half numbers into one half2 number.

#### Returns

Returns half2 number which has one half equal to a and the other to b.

# Description

Combines two input half number a and b into one half2 number. Input a is stored in low 16 bits of the return value, input b is stored in high 16 bits of the return value.

\_\_CUDA\_FP16\_DECL\_\_ float \_\_high2float (const \_\_half2 a)

Converts high 16 bits of half2 to float and returns the result.

#### Returns

Returns high 16 bits of a converted to float.

# Description

Converts high 16 bits of half2 input a to 32 bit floating point number and returns the result.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half \_\_high2half (const \_\_half2 a)

Returns high 16 bits of half2 input.

#### Returns

Returns half which contains high 16 bits of the input.

#### Description

Returns high 16 bits of half2 input a.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half2 \_\_high2half2 (const \_\_half2 a)

Extracts high 16 bits from half2 input.

#### Returns

Returns half2 with both halves equal to high 16 bits from the input.

Extracts high 16 bits from half2 input a and returns a new half2 number which has both halves equal to the extracted bits.

\_\_CUDA\_FP16\_DECL\_\_ \_half2 \_\_highs2half2 (const \_\_half2 a, const \_\_half2 b)

Extracts high 16 bits from each of the two half2 inputs and combines into one half2 number.

# Returns

Returns half2 which contains high 16 bits from a and b.

# Description

Extracts high 16 bits from each of the two half2 inputs and combines into one half2 number. High 16 bits from input a is stored in low 16 bits of the return value, high 16 bits from input b is stored in high 16 bits of the return value.

\_\_CUDA\_FP16\_DECL\_\_ float \_\_low2float (const \_\_half2 a)

Converts low 16 bits of half2 to float and returns the result.

## **Returns**

Returns low 16 bits of a converted to float.

## Description

Converts low 16 bits of half2 input a to 32 bit floating point number and returns the result.

\_\_CUDA\_FP16\_DECL\_\_ \_\_half \_\_low2half (const \_\_half2 a)

Returns low 16 bits of half2 input.

#### Returns

Returns half which contains low 16 bits of the input.

# Description

Returns low 16 bits of half2 input a.

CUDA_FP16_DECLhalf2low2half2 (consthalf	2 8	a)
---	-----	----

Extracts low 16 bits from half2 input.

#### Returns

Returns half2 with both halves equal to low 16 bits from the input.

# Description

Extracts low 16 bits from half2 input a and returns a new half2 number which has both halves equal to the extracted bits.

\_\_CUDA\_FP16\_DECL\_\_ \_half2 \_\_lowhigh2highlow (const \_\_half2 a) Swaps both halves of the half2 input.

#### **Returns**

Returns half2 with halves swapped.

# Description

Swaps both halves of the half2 input and returns a new half2 number with swapped halves.

\_\_CUDA\_FP16\_DECL\_\_ \_half2 \_\_lows2half2 (const \_\_half2 a, const \_\_half2 b)

Extracts low 16 bits from each of the two half2 inputs and combines into one half2 number.

#### Returns

Returns half2 which contains low 16 bits from a and b.

# Description

Extracts low 16 bits from each of the two half2 inputs and combines into one half2 number. Low 16 bits from input a is stored in low 16 bits of the return value, low 16 bits from input b is stored in high 16 bits of the return value.
